CEH Hacking Methodology (CHM)

System Hacking Goals

Hacking-Stage

**Gaining Access****Escalating Privileges****Executing Applications****Hiding Files****Covering Tracks**

Goal

To bypass access controls to gain access to the system

To acquire the rights of another user or an admin

To create and maintain remote access to the system

To hide attackers malicious activities and data theft

To hide the evidence of compromise

Technique/Exploit Used

Password cracking, social engineering

Exploiting known system vulnerabilities

Trojans, spywares, backdoors, keyloggers

Rootkits, steganography

Clearing logs

Module Flow

1 System Hacking Concepts

2 Cracking Passwords

3 Escalating Privileges

4 Executing Applications

5 Hiding Files

6 Covering Tracks

7 Penetration Testing

Password Cracking

Password cracking techniques are used to **recover passwords** from computer systems

Attackers use password cracking techniques to **gain unauthorized access** to vulnerable system

Most of the password cracking techniques are successful due to weak or easily **guessable passwords**

Types of Password Attacks

Non-Electronic Attacks

Attacker need not posses **technical knowledge** to crack password, hence known as non-technical attack

- Shoulder Surfing
- Social Engineering
- Dumpster Diving

Active Online Attacks

Attacker performs password cracking by **directly communicating** with the victim machine

- Dictionary and Brute Forcing Attack
- Hash Injection and Phishing
- LLMNR/NBT-NS Poisoning
- Trojan/Spyware/Keyloggers
- Password Guessing

Passive Online Attacks

Attacker performs password cracking **without communicating** with the authorizing party

- Wire Sniffing
- Man-in-the-Middle Attack
- Replay Attack

Offline Attacks

Attacker copies the target's **password file** and then tries to crack passwords in his own system at different location

- Rainbow Table Attack (Pre-Computed Hashes)
- Distributed Network Attack

Non-Electronic Attacks

Social Engineering

Convincing people to reveal passwords

Shoulder Surfing

Looking at either the user's keyboard or screen while he/she is logging in

Dumpster Diving

Searching for sensitive information in the user's trash-bins, printer trash bins, and user desk for sticky notes

Active Online Attack: Dictionary, Brute Forcing, and Rule-based Attack

Dictionary Attack

A **dictionary file** is loaded into the cracking application that runs against **user accounts**

Brute Forcing Attack

The program tries **every combination of characters** until the password is broken

Rule-based Attack

This attack is used when the attacker gets some **information about the password**

Active Online Attack: Password Guessing

Frequency of attacks is less

The attacker creates a list of all possible passwords from the information collected through **social engineering** or any other way and tries them manually on the victim's machine to **crack the passwords**

The failure rate is high

1

2

3

4

Find a **valid** user

Create a **list** of possible passwords

Rank passwords from **high** probability to **low**

Key in each password, until **correct password** is discovered

Default Passwords

- A default password is a **password supplied by the manufacturer** with new equipment (e.g. switches, hubs, routers) that is password protected
- Attackers use **default passwords** present in the list of words or dictionary that they use to **perform password guessing attack**

DEFAULT PASSWORDS Open Sez Me! :: Passwords

846 Default Passwords for thousands of systems from 774 vendors!

Last Updated: 11/1/2016 6:21:29 PM

To begin, Select the vendor of the product you are looking for.
[Click here](#) to add new default passwords to this list.

- <http://defaultpasswords.in>
- <http://www.routerpasswords.com>
- <http://www.defaultpassword.com>
- <https://default-password.info>

Active Online Attack: Trojan/Spyware/Keylogger

- Attacker installs Trojan/Spyware/Keylogger on victim's machine to collect victim's **user names and passwords**
- Trojan/Spyware/Keylogger **runs in the background** and sends back all user credentials to the attacker

Example of Active Online Attack Using USB Drive

Active Online Attack: Hash Injection Attack

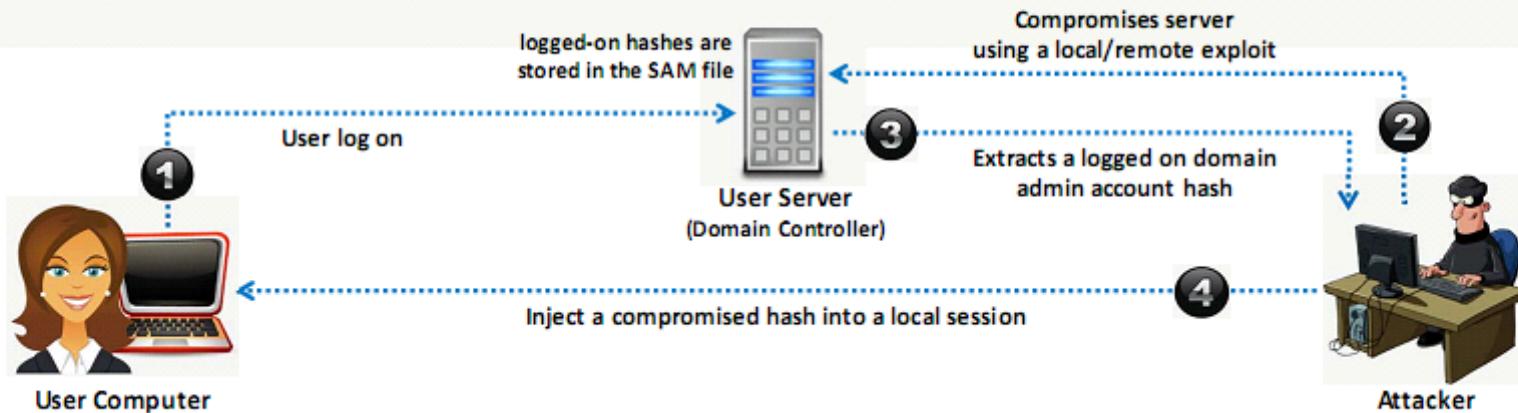

A hash injection attack allows an attacker to **inject a compromised hash** into a local session and use the hash to validate network resources

The attacker finds and extracts a logged on **domain admin account hash**

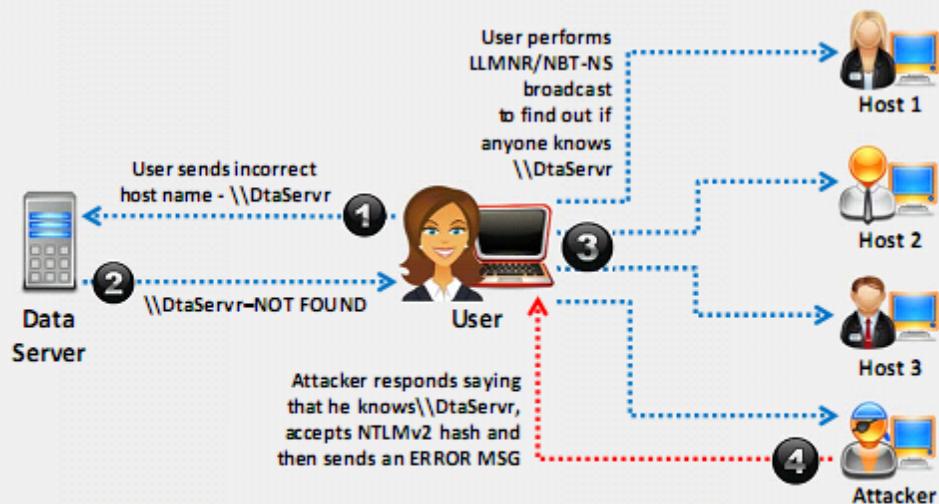

The attacker uses the extracted hash to log on to the **domain controller**

Active Online Attack: LLMNR/NBT-NS Poisoning

- LLMNR and NBT-NS are two main elements of **Windows operating systems** used to perform **name resolution** for hosts present on the same link
- The attacker cracks the **NTLMv2 hash** obtained from the victim's authentication process
- The extracted credentials are used to log on to the **host system in the network**

LLMNR/NBT-NS Spoofing Tool: Responder

- Metasploit (<https://www.metasploit.com>)
- NBNSpoof (<https://github.com>)
- Inveigh (<https://github.com>)

Passive Online Attack: Wire Sniffing

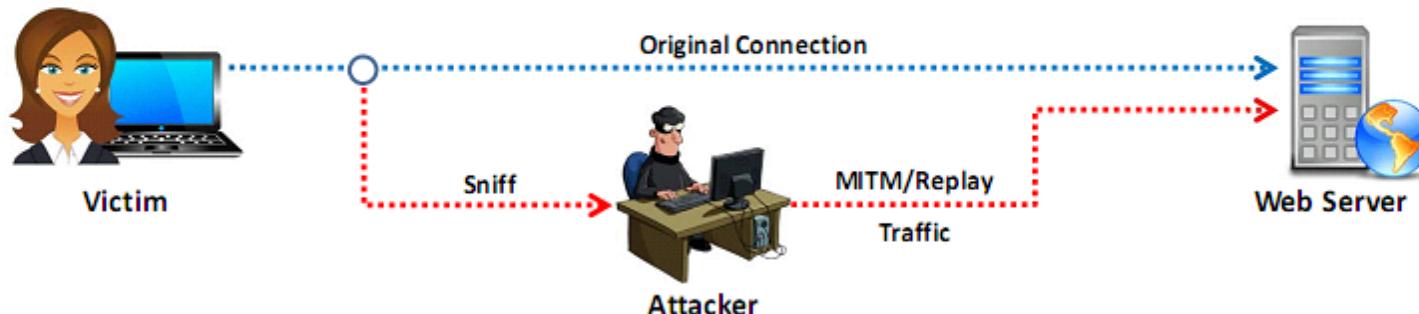

- Attackers run **packet sniffer tools** on the local area network (LAN) to access and record the raw network traffic
- The captured data may include **sensitive information** such as **passwords** (FTP, rlogin sessions, etc.) and emails
- Sniffed credentials are used to **gain unauthorized access** to the target system

Wire Sniffing → Computationally Complex → Hard to Perpetrate

Passive Online Attacks: Man-in-the-Middle and Replay Attack

- In a MITM attack, the attacker acquires **access** to the communication channels between victim and server to extract the information
- In a replay attack, packets and authentication tokens are captured using a **sniffer**. After the relevant info is extracted, the tokens are placed back on the network to gain access

Considerations

- Relatively **hard to perpetrate**
- Must be **trusted** by one or both sides
- Can sometimes be broken by **invalidating traffic**

Offline Attack: Rainbow Table Attack

Rainbow Table

A rainbow table is a precomputed table which contains word lists like **dictionary files** and **brute force lists** and their **hash values**

Compare the Hashes

Capture the hash **of passwords** and compare it with the precomputed hash table. If a match is found then the password is cracked

Easy to Recover

It is easy to recover passwords by comparing captured password hashes to the **precomputed tables**

Precomputed Hashes

1qazwed	→ 4259cc34599c530b28a6a8f225d668590

Tools to Create Rainbow Tables: rtgen and Winrtgen

rtgen

- The rtgen program needs **several parameters** to generate a rainbow table. Syntax for the command line is:

Syntax: rtgen hash_algorithm charset plaintext_len_min plaintext_len_max table_index chain_len chain_num part_index

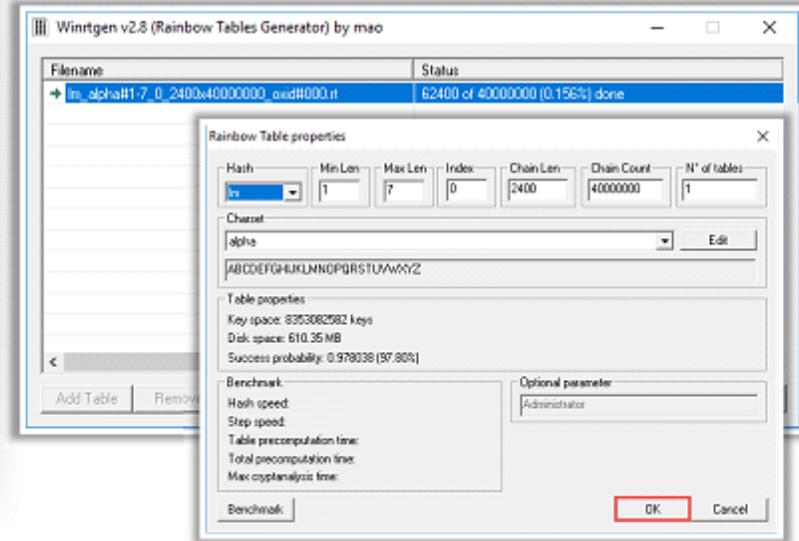

```
Command Prompt - rtgen ntlm loweralpha-numeric 1 7 0 1000 4000000 0
C:\Users\Test\Desktop\rainbowcrack-1.7-win64>rtgen ntlm loweralpha-numeric 1 7 0 1000 4000000 0
rainbow table ntlm_loweralpha-numeric#1_0_1000x4000000_0.rt parameters
hash algorithm:      ntlm
hash length:        16
charset name:       loweralpha-numeric
charset data:        abcdefghijklmnopqrstuvwxyz0123456789
charset data in hex: 61 62 63 64 65 66 67 68 69 6a 6b 6c 6d 6e 6f 70 71 72 73 74 75 76 77 78
79 7a 30 31 32 33 34 35 36 37 38 39
charset length:     36
plaintext length range: 1 - 7
reduce offset:      0x00000000
plaintext total:    88663140212

sequential starting point begin from 0 (0x0000000000000000)
generating...
131872 of 4000000 rainbow chains generated (0 m 8.3 s)

```

<http://project-rainbowcrack.com>

Winrtgen

- Winrtgen is a graphical **rainbow table generator** that supports LM, FastLM, NTLM, LMCHALL, HalfLMCHALL, NTLMCHALL, MSCACHE, MD2, MD4, MD5, SHA1, RIPEMD160, MySQL323, MySQLSHA1, CiscoPIX, ORACLE, SHA-2 (256), SHA-2 (384), and SHA-2 (512) hashes

<http://www.oxid.it>

Offline Attack: Distributed Network Attack

- A Distributed Network Attack (DNA) technique is used for **recovering passwords from hashes or password protected files** using the unused processing power of machines across the network to decrypt passwords

The DNA Manager is installed in a **central location** where machines running on DNA Client can access it over the network

DNA Manager coordinates the attack and **allocates small portions of the key search** to machines that are distributed over the network

DNA Client **runs in the background** consuming only unused processor time

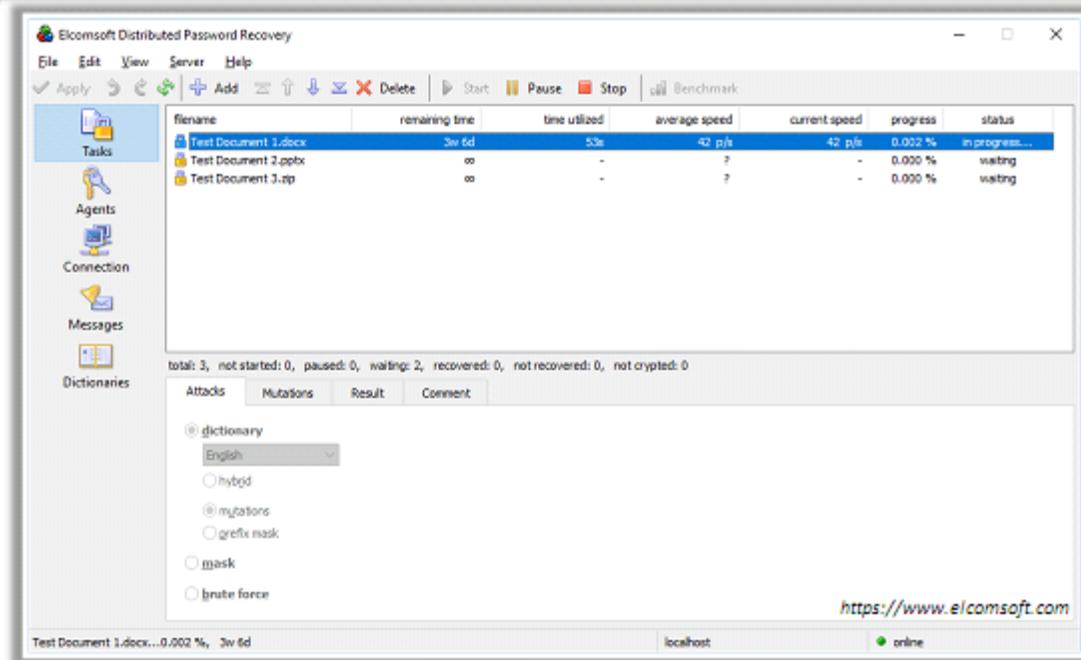

The program combines processing capabilities of all the clients connected to network and uses it to **crack the password**

Password Recovery Tools

Elcomsoft Distributed Password Recovery

- Elcomsoft Distributed Password Recovery breaks **complex passwords**, recovers strong **encryption keys**, and **unlocks documents** in a production environment

Security Accounts Manager (SAM) Database

- Windows stores user passwords in SAM, or in the **Active Directory database** in domains. Passwords are never stored in clear text; passwords are hashed and the results are stored in the SAM

NTLM Authentication

- The NTLM authentication protocol types are: **NTLM authentication protocol** and **LM authentication protocol**
- These protocols store user's password in the SAM database using different hashing methods

Kerberos Authentication

- Microsoft has upgraded its **default authentication protocol** to Kerberos which provides a stronger authentication for client/server applications than NTLM

How Hash Passwords Are Stored in Windows SAM?

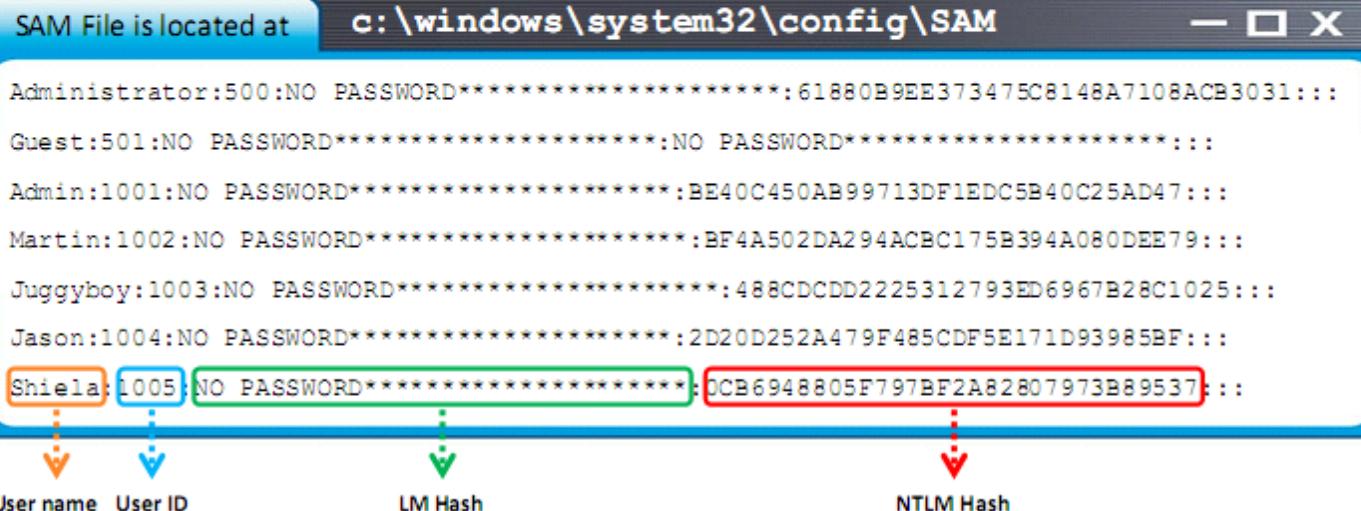

Shiela/test

Password hash using LM/NTLM

```
Shiela:1005:NO PASSWORD*****:*****:OCB6948805F797BF2A82807973B89537:::
```

"LM hashes have been disabled in **Windows Vista** and **later Windows operating systems**, LM will be **blank** in those systems."

NTLM Authentication Process

Client Computer

User types password into logon window

1

Shiela

Hash Algorithm

Windows runs password through hash algorithm

2

Shiela:1005:NO PASSWORD****
*****:0CB694880
5F797BF2A82807973B89537:::

3

Computer sends login request to DC

Aa r8 ppq kgj89 pqr

5

Computer sends response to challenge

Window Domain Controller

Domain controller has a stored copy of the user's hashed password

Shiela:1005:NO PASSWORD****
*****:0CB694880
5F797BF2A82807973B89537:::

4

DC compares computer's response with the response it created with its own hash

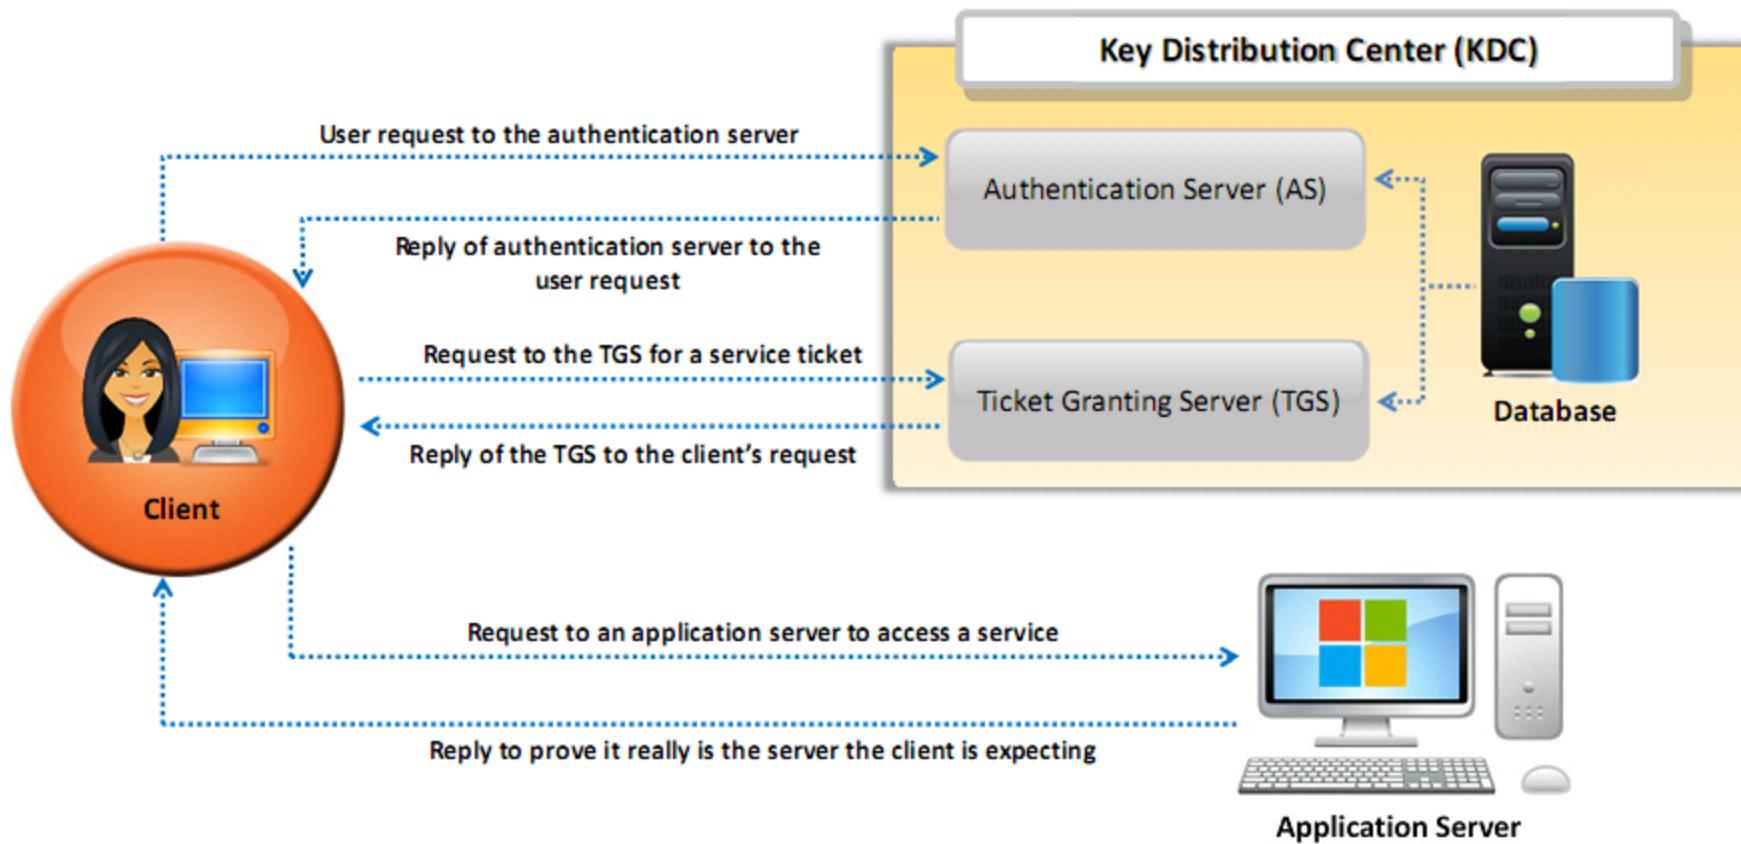

If they match, the logon is a success

6

Aa r8 ppq kgj89 pqr

Note: Microsoft has upgraded its default authentication protocol to Kerberos, which provides strong authentication for client/server applications than NTLM.

Kerberos Authentication

Password Salting

- Password salting is a technique where **random string of characters are added** to the password before calculating their hashes

- **Advantage:** Salting makes it more difficult to reverse the hashes and defeat pre-computed hash attacks

Alice:root:b4ef21:**bba4303ce24a83fe0317608de02bf38d**

Bob:root:a9c4fa:**3282abd0308323ef0349dc7232c349ac**

Cecil:root:209be1:**a483b303c23af34761de02be038fde08**

Same password but
different hashes due to
different salts

Note: Windows password hashes are not salted

Tools to Extract the Password Hashes

pwdump7

- **pwdump7** extracts **LM** and **NTLM** password hashes of local user accounts from the **Security Account Manager (SAM)** database

```
Administrator: Command Prompt

Note: These tools must be run with administrator privileges

L0phtCrack

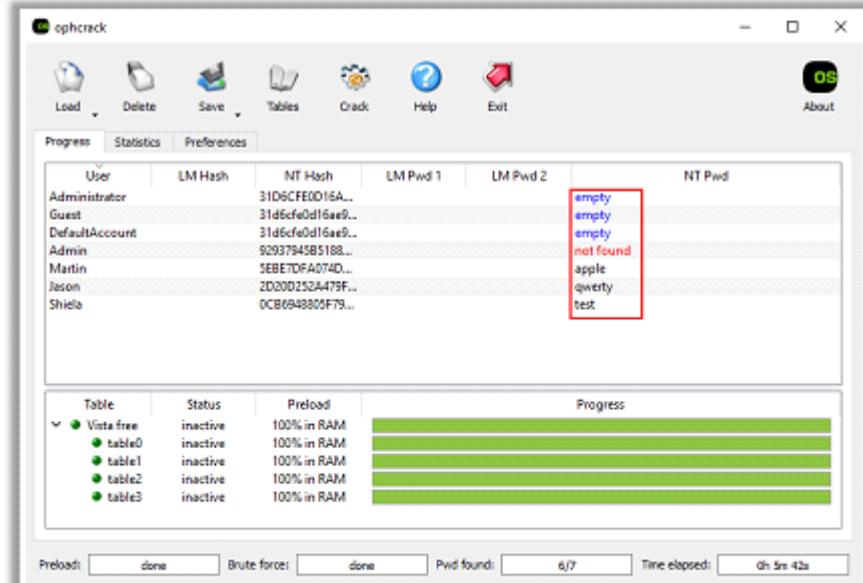

L0phtCrack is a password **auditing** and **recovery** application packed with features such as scheduling, hash extraction from 64-bit Windows versions, and networks monitoring and decoding

<http://www.l0phtcrack.com>

ophcrack

ophcrack is a Windows password cracker based on **rainbow tables**. It comes with a **Graphical User Interface** and runs on multiple platforms

<http://ophcrack.sourceforge.net>

Password Cracking Tools

RainbowCrack

RainbowCrack cracks hashes with **rainbow tables**. It uses **time-memory tradeoff** algorithm to crack hashes

The screenshot shows the RainbowCrack application window. At the top, there's a menu bar with File, Edit, View, Rainbow Table, and Help. Below the menu is a table with four columns: Hash, Plaintext, Plaintext in Hex, and Comment. Several rows of hash entries are listed, with the last row highlighted by a red box. The 'Comment' column lists user names: Administrator, Guest, DefaultAccount, Admin, Martin, Jason, and Sheila. Below the table is a 'Messages' section containing the text: 'plaintext of 2d20d252a479f485cdf5e171d93985bf is qwerty'. Underneath is a 'statistics' section with various performance metrics.

Hash	Plaintext	Plaintext in Hex	Comment
31d6cfe0d16ae931b73c59d7e0c089c0	<not found>	<not found>	Administrator
31d6cfe0d16ae931b73c59d7e0c089c0	<not found>	<not found>	Guest

How to Defend against Password Cracking

- 1 Enable **information security audit** to monitor and track password attacks
- 2 Do not use the **same password** during password change
- 3 Do not **share** passwords
- 4 Do not use passwords that can be found in a **dictionary**
- 5 Do not use **cleartext** protocols and protocols with **weak encryption**
- 6 Set the **password change policy** to 30 days
- 7 Avoid **storing passwords** in an unsecured location
- 8 Do not use any system's **default passwords**

How to Defend against Password Cracking (Cont'd)

9 Make passwords hard to guess by using **8-12 alphanumeric** characters in combination of uppercase and lowercase letters, numbers, and symbols

10 Ensure that applications **neither store** passwords to memory **nor write** them to disk in clear text

11 Use a **random string** (salt) as prefix or suffix with the password before encrypting

12 Enable **SYSKEY** with strong password to encrypt and protect the SAM database

13 Never use passwords such as **date of birth**, spouse, or child's or pet's name

14 Monitor the **server's logs** for brute force attacks on the users accounts

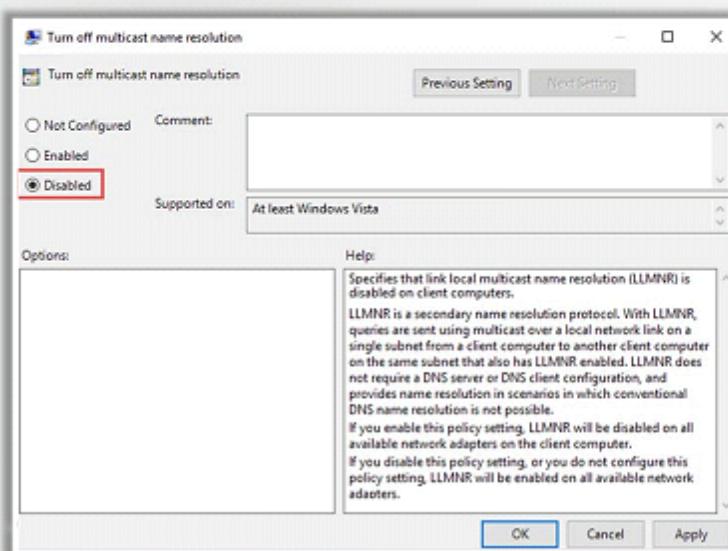

15 Lock out an account subjected to too many **incorrect password** guesses

How to Defend against LLMNR/NBT-NS Poisoning

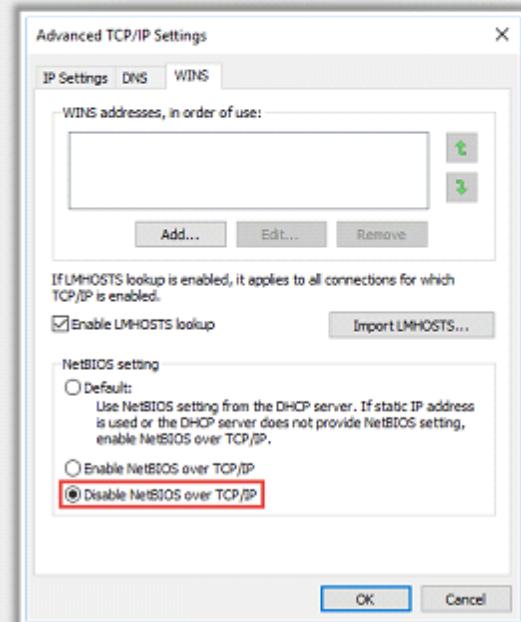

Disable LMBNR

- ➊ Open Local Group Policy Editor and navigate to Local Computer Policy → Computer Configuration → Administrative Templates → Network → DNS Client
- ➋ In DNS client, double-click on Turn off multicast name resolution
- ➌ Select the Disabled radio button and then click OK

Disable NBT-NS

- ➊ Open Control Panel and navigate to Network and Internet → Network and Sharing Center and click on Change adapter settings option present on the right side
- ➋ Right-click on the network adapter and click Properties, select TCP/IPv4 and then click Properties
- ➌ Under General tab, go to Advanced → WINS
- ➍ From the NetBIOS options, check "Disable NetBIOS over TCP/IP" radio button and click OK

Cracking Passwords

3

Escalating Privileges

4

Executing Applications

5

Hiding Files

6

Covering Tracks

7

Penetration Testing

- An attacker can gain access to the network using a **non-admin user account** and the next step would be to gain administrative privileges
- Attacker performs privilege escalation attack which takes advantage of **design flaws, programming errors, bugs**, and **configuration oversights** in the OS and software application to gain administrative access to the network and its associated applications
- These privileges allows attacker to **view critical/sensitive information**, delete files, or install malicious programs such as viruses, Trojans, worms, etc.

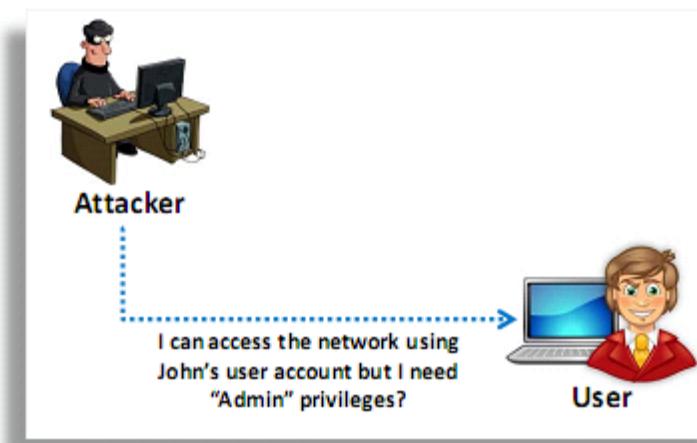

Types of Privilege Escalation

2. Horizontal Privilege Escalation

- Refers to acquiring the same level of privileges that already has been granted but assuming the identity of another user with the similar privileges

1. Vertical Privilege Escalation

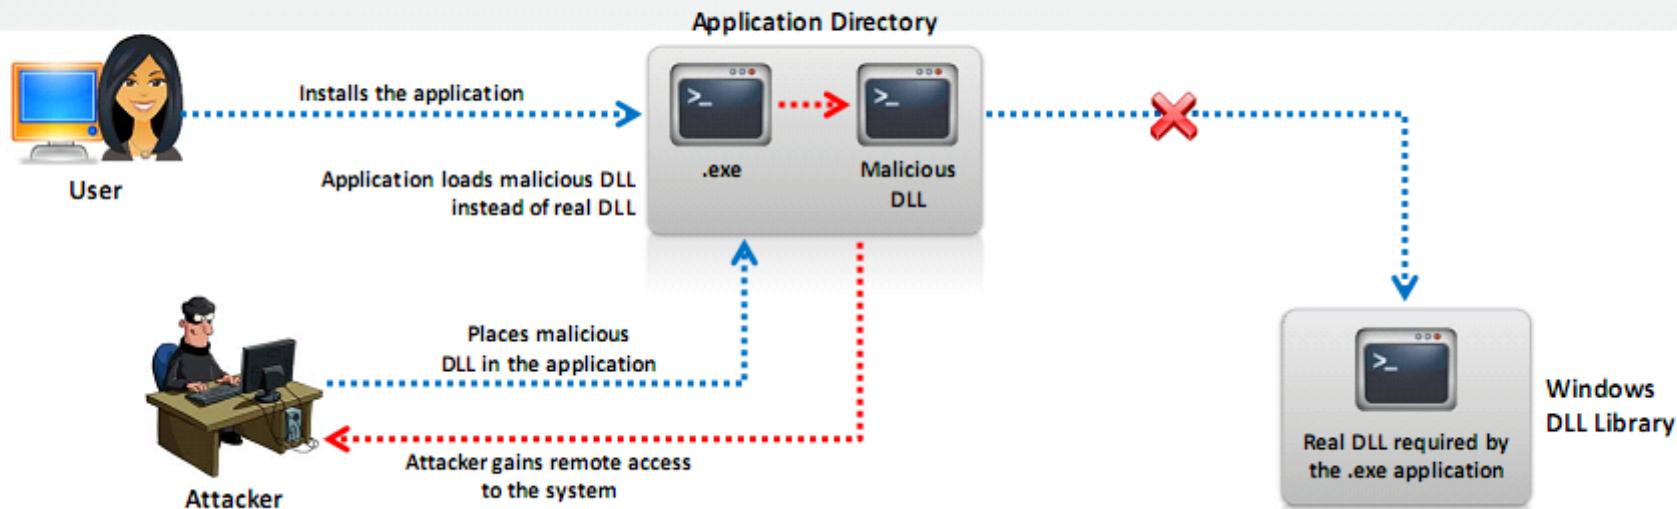

- Refers to gaining higher privileges than the existing

Privilege Escalation Using DLL Hijacking

 Most Windows applications do not use the **fully qualified path** when loading an external DLL library instead they search directory from which they have been loaded first

 If attackers can place a **malicious DLL in the application directory**, it will be executed in place of the real DLL

Privilege Escalation by Exploiting Vulnerabilities

- Attackers **exploit software vulnerabilities** by taking advantage of programming flaws in a program, service, or within the operating system software or kernel to **execute malicious code**
- Exploiting software vulnerabilities allows attacker to execute a command or binary on a target machine to **gain higher privileges** than the existing or **bypass security mechanisms**
- Attackers using these exploits can access **privileged user accounts** and credentials
- Attackers search for an exploit based on the OS and software application on exploit sites such as **SecurityFocus** (<http://www.securityfocus.com>), **Exploit Database** (<https://www.exploit-db.com>), etc.

EXPLOIT DATABASE

Search the Exploit Database

Search the Database for Exploits, Papers, and Shellcode. You can even search by CVE and OSVDB Identifiers.

Privelege Escalation

<https://www.exploit-db.com>

Privilege Escalation Using Dylib Hijacking

- In OS X, applications while **loading an external dylib** (dynamic library), the loader searches for dylib in multiple directories
- If attackers can **inject a malicious dylib** in one of the primary directories, it will be executed in place of the original dylib

Privilege Escalation Using Spectre and Meltdown Vulnerabilities

- Spectre and Meltdown are vulnerabilities found in **the design of the modern processor chips** from AMD, ARM, and Intel
- The **performance and CPU optimizations** in the processors such as branch prediction, out of order execution, caching, and speculative execution lead to these vulnerabilities
- Attackers exploit these vulnerabilities to gain unauthorized access and **steal critical system information such as credentials, secret keys**, etc. stored in the application's memory to escalate privileges

Spectre Vulnerability

- Attackers may take advantage of this vulnerability to **read adjacent memory locations of a process** and access information for which he/she is not authorized
- Using this vulnerability an attacker can even **read the kernel memory** or perform a web based attack using JavaScript

Meltdown Vulnerability

- Attackers may take advantage of this vulnerability to **escalate privileges by forcing an unprivileged process** to read other adjacent memory locations such as kernel memory and physical memory
- This leads to revealing of critical system information such as **credentials, private keys**, etc.

Other Privilege Escalation Techniques

Access Token Manipulation

- Windows operating system uses access tokens to **determine the security context** of a process or thread
- Attackers can obtain access tokens of other users or generate **spoofed tokens** to escalate privileges and perform malicious activities by evading detection

Application Shimming

- Windows Application Compatibility Framework, shim is used to **provide compatibility** between the older and newer versions of Windows operating system
- Shims like **RedirectEXE**, **injectDLL**, and **GetProcAddress** can be used by attackers to escalate privileges, install backdoors, disable Windows defender, etc.

File System Permissions Weakness

- If the file system permissions of binaries are not properly set, an attacker can **replace the target binary** with a malicious file
- If the process that is executing this binary is having **higher level permissions** then the malicious binary also executes under higher level permissions

Path Interception

- Applications include many **weaknesses** and **misconfigurations** like unquoted paths, path environment variable misconfiguration, and search order hijacking that lead to path interception
- Path interception helps an attacker to **maintain persistence** on a system and **escalate privileges**

Scheduled Task

- Windows Task Scheduler** along with utilities such as 'at' and 'schtasks' can be used to schedule programs that can be executed at a specific date and time
- Attacker can use this technique to **execute malicious programs** at system startup, maintain persistence, perform remote execution, escalate privileges, etc.

Other Privilege Escalation Techniques (Cont'd)

Launch Daemon

- **Launchd** is used in MacOS and OS X boot up to complete the system initialization process by loading parameters for each launch-on-demand system-level daemon
- Daemons have **plists** that are linked to executables that run at start up
- Attacker can **alter the launch daemon's** executable to maintain persistence or to escalate privileges

Plist Modification

- **Plist files** in MacOS and OS X describe when programs should execute, executable file path, program parameters, required OS permissions, etc.
- Attackers alter plist files to **execute malicious code** on behalf of a legitimate user to escalate privileges

Setuid and Setgid

- In Linux and MacOS, if an application uses **setuid** or **setgid** then the application will execute with the privileges of the owning user or group
- An attacker can **exploit the applications** with the setuid or setgid flags to execute malicious code with elevated privileges

Web Shell

- A Web shell is a **web-based script** that allows access to a web server
- Attackers create web shells to **inject malicious script** on a web server to maintain persistent access and escalate privileges

How to Defend Against Privilege Escalation (Cont'd)

- 1 Restrict the **interactive logon privileges**
- 2 Use **encryption technique** to protect sensitive data
- 3 Run users and applications on the **least privileges**
- 4 Reduce the **amount of code** that runs with particular privilege
- 5 Implement **multi-factor authentication** and **authorization**
- 6 Perform **debugging** using bounds checkers and stress tests
- 7 Run services as **unprivileged accounts**
- 8 Test operating system and **application coding errors** and **bugs** thoroughly
- 9 Implement a **privilege separation methodology** to limit the scope of programming errors and bugs
- 10 Patch and **update** the kernel regularly

How to Defend Against Privilege Escalation (Cont'd)

- 11 Change User Account Control settings to "Always Notify"
- 12 Restrict users from writing files to the **search paths** for applications
- 13 Continuously **monitor file system permissions** using auditing tools
- 14 **Reduce the privileges** of users and groups so that only legitimate administrators can make service changes
- 15 Use **whitelisting tools** to identify and block malicious software
- 16 Use **fully qualified paths** in all the Windows applications
- 17 Ensure that **all** executables are placed in **write-protected directories**
- 18 In Mac operating systems, **make plist files read-only**
- 19 **Block unwanted system utilities** or software that may be used to schedule tasks
- 20 Patch and update the **web servers** regularly

7

Penetration Testing

Executing Applications

- Attackers execute malicious applications in this stage. This is called “**owning**” the system
- Attacker executes malicious programs **remotely in the victim's machine** to gather information that leads to exploitation or loss of privacy, **gain unauthorized access** to system resources, **crack the password**, capture the screenshots, install backdoor to maintain easy access, etc.

Keyloggers

Backdoors

Malicious Programs Attackers Execute on Target Systems

Spyware

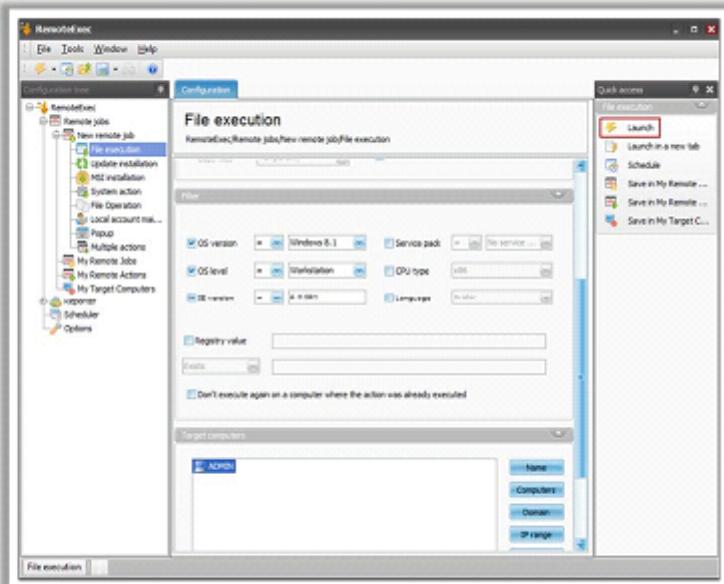

Crackers

Tools for Executing Applications

RemoteExec

- RemoteExec **remotely installs applications, executes programs/scripts, and updates files and folders on Windows systems throughout the network**
- It allows attacker to **modify the registry, change local admin passwords, disable local accounts, and copy/ update/delete files and folders**

<https://www.insecure.com>

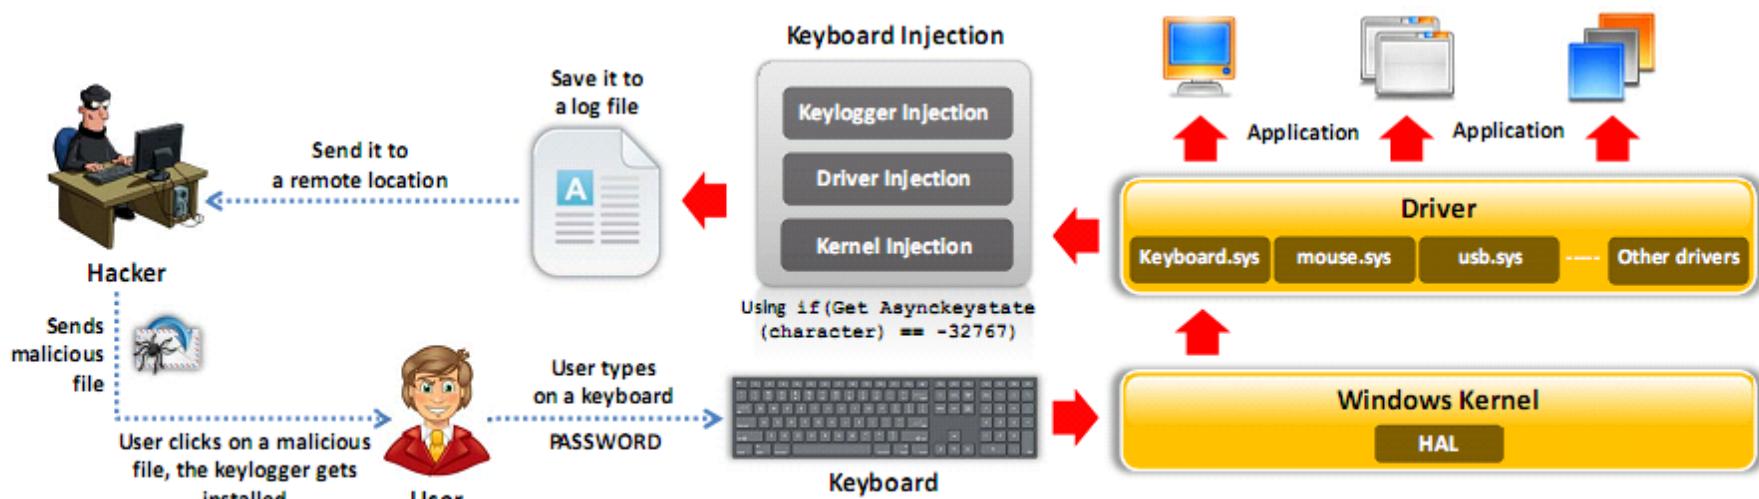

Tools for Executing Applications

- PDQ Deploy (<https://www.pdq.com>)
- Dameware Remote Support (<https://www.dameware.com>)
- ManageEngine Desktop Central (<https://www.manageengine.com>)
- PsExec (<https://docs.microsoft.com>)
- TheFatRat (<https://github.com>)

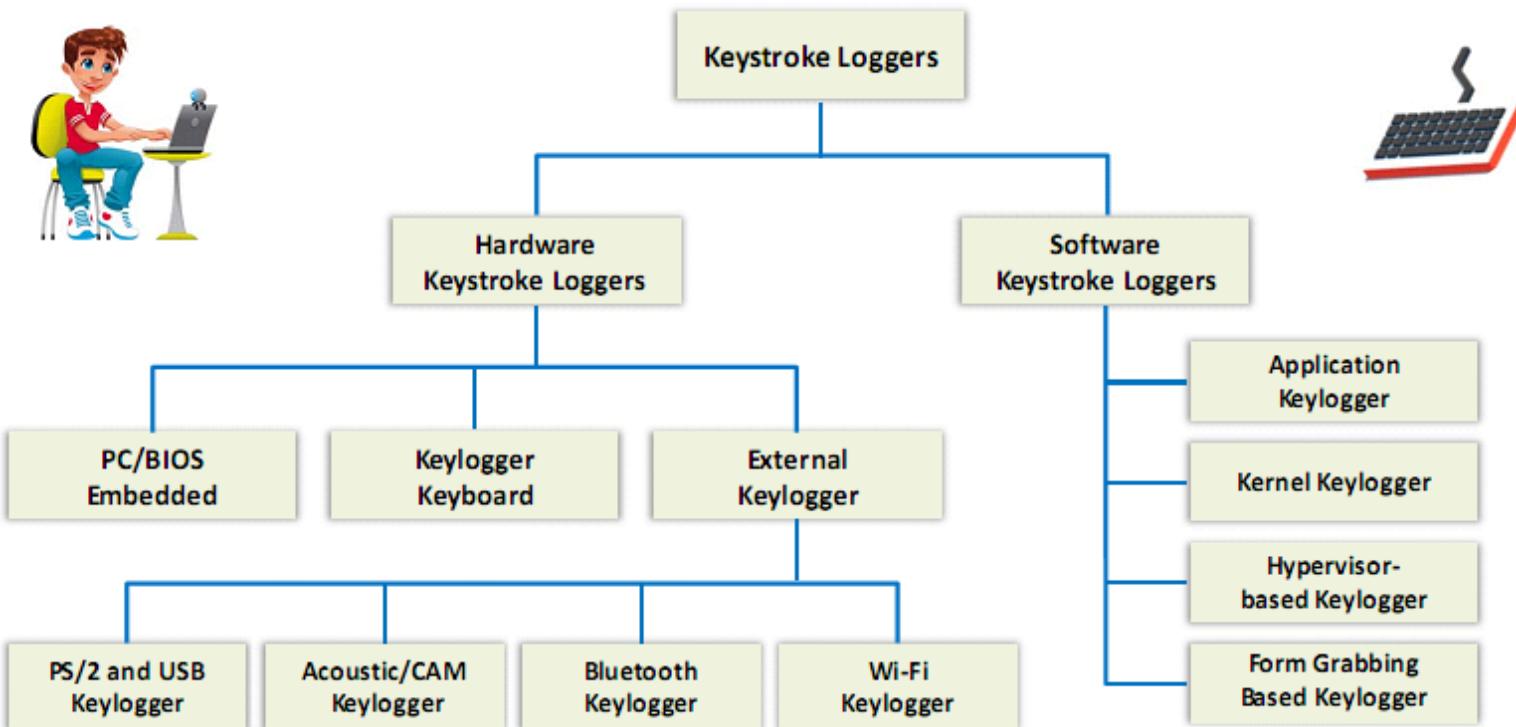

Keylogger

- Keystroke loggers are programs or hardware devices that **monitor each keystroke** as user types on a keyboard, logs onto a file, or transmits them to a remote location
- Legitimate applications for keyloggers include in office and industrial settings to monitor **employees' computer activities** and in home environments where parents can monitor and spy on **children's activity**
- It allows attacker to **gather confidential information** about victim such as email ID, passwords, banking details, chat room activity, IRC, instant messages, etc.
- Physical keyloggers are placed between the **keyboard hardware** and the **operating system**

Types of Keystroke Loggers

Hardware Keyloggers

KeyGrabber The Keylogger.

Wi-Fi USB keylogger now available! KeyGrabber Wi-Fi hardware keyloggers send E-mail reports with recorded keystrokes. Compatible with any USB keyboard, totally stealthy, time-stamping available. The most advanced hardware keylogger available...

What is a hardware keylogger?

A **hardware keylogger** is an electronic device capable of capturing keystrokes from a PS/2 or USB keyboard.

A **hardware video-logger** is a tiny frame-grabber for capturing screenshots from a VGA, DVI, or HDMI video source.

KeyGrabber is the world's leading manufacturer of hardware keylogger and video-logging technology.

Hardware keylogger installation

Installing a hardware keylogger takes less than 5 seconds!

Wi-Fi wireless keylogger access

KeyGrabber USB

Now \$45.99!

- ✓ Built-in memory up to 2 Gigabytes
- ✓ Works with any USB keyboard, including wireless ones
- ✓ No software or drivers required
- ✓ Windows, Linux, and Mac compatible
- ✓ Mac Compatibility Pack (MCP) option, enhancing performance on all Mac systems
- ✓ Memory protected with strong 128-bit encryption
- ✓ Totally stealthy, undetectable for security scanners
- ✓ Quick and easy national keyboard layout support

Spyware

- Spyware is a stealthy program that **records user's interaction** with the computer and Internet without the user's knowledge and sends them to the remote attackers
- Spyware **hides its process**, files, and other objects in order to avoid detection and removal
- It is similar to Trojan horse, which is usually bundled as a **hidden component of freeware programs** that can be available on the Internet for download
- It allows attacker to **gather information about a victim or organization** such as **email addresses**, user logins, passwords, credit card numbers, banking credentials, etc.

How to Defend Against Keyloggers

- 1 Use pop-up blocker and avoid opening junk emails
- 2 Install anti-spyware/antivirus programs and keeps the signatures up to date
- 3 Install professional firewall software and anti-keylogging software
- 4 Recognize phishing emails and delete them
- 5 Update and patch system software regularly
- 6 Do not click on links in unwanted or doubtful emails that may point to malicious sites
- 7 Use keystroke interference software, which inserts randomized characters into every keystroke
- 8 Scan the files before installing and use registry editor or process explorer to check for the keystroke loggers
- 9 Use Windows on-screen keyboard accessibility utility to enter the password or any other confidential information
- 10 Install a host-based IDS, which can monitor your system and disable the installation of keyloggers
- 11 Use automatic form-filling password manager or virtual keyboard to enter user name and password
- 12 Use software that frequently scans and monitors the changes in the system or network

How to Defend Against Keyloggers (Cont'd)

Hardware Keylogger Countermeasures

01

Restrict **physical access** to sensitive computer systems

02

Periodically **check all the computers** and check whether there is any hardware device connected to the computer

03

Use **encryption** between the keyboard and its driver

04

Use an **anti-keylogger** that detects the presence of a hardware keylogger such as Oxynger KeyShield

05

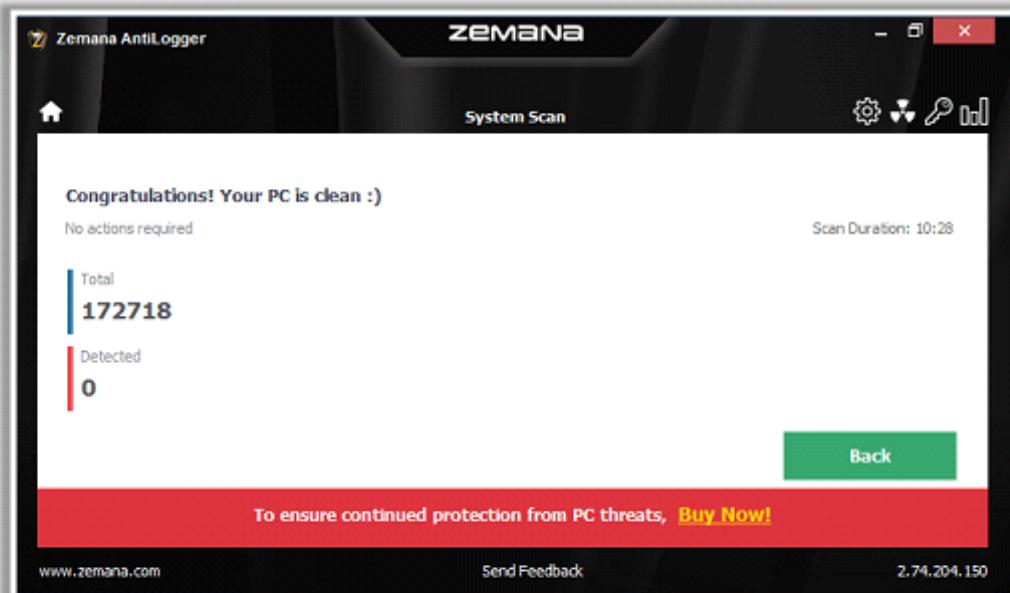

Use an **on-screen keyboard** and click on it by using a mouse

Anti-Keylogger

Zemana AntiLogger

It **keeps track** of who is doing what on your PC. It monitors your PC against the bad guys and **prevents any kind of attempts** to record or steal your private data and blocks any kind of suspicious activity

How to Defend Against Spyware

- 1 Try to avoid using any computer system which is not totally under your control
- 2 Adjust **browser security settings** to medium or higher for Internet zone
- 3 Be cautious about **suspicious emails** and sites
- 4 Enable firewall to enhance the **security level** of the computer
- 5 Update the software regularly and use a **firewall** with outbound protection
- 6 Regularly check **task manager report** and MS configuration manager report
- 7 **Update virus definition files** and scan the system for spyware regularly
- 8 Install and use **anti-spyware** software
- 9 Perform **web surfing** safely and download cautiously
- 10 Do not use **administrative mode** unless it is necessary
- 11 Keep your operating system **up to date**
- 12 Do not download free **music files, screensavers, or smiley faces** from Internet
- 13 Beware of **pop-up windows** or **web pages**. Never click anywhere on these windows
- 14 Carefully read all disclosures, including the license agreement and **privacy statement** before installing any application

Anti-Spyware

SUPERAntiSpyware

- Identify potentially unwanted programs and securely removes them
- Detect and remove Spyware, Adware, Malware, Trojans, Dialers, Worms, Keyloggers, Hijackers, Parasites, Rootkits, Rogue security products, and many other types of threats

5 Hiding Files

6 Covering Tracks

7 Penetration Testing

Rootkits

- Rootkits are programs that **hide their presence** as well as attacker's malicious activities, granting them full access to the server or host at that time and also in future
- Rootkits replace certain operating system calls and utilities with its own **modified versions** of those routines that in turn undermine the security of the target system causing **malicious functions** to be executed
- A typical rootkit comprises of backdoor programs, DDoS programs, packet sniffers, log-wiping utilities, IRC bots, etc.

Attacker places a rootkit by:

- Scanning for **vulnerable** computers and servers on the web
- **Wrapping** it in a special package like games
- Installing it on the public computers or corporate computers through **social engineering**
- Launching **zero day attack** (privilege escalation, buffer overflow, Windows kernel exploitation, etc.)

Objectives of Rootkit

- To **root** the host system and **gain remote backdoor** access
- To mask **attacker tracks** and presence of malicious applications or processes
- To gather **sensitive data, network traffic**, etc. from the system to which attackers might be restricted or possess no access
- To store other **malicious programs** on the system and act as a server resource for bot updates

Types of Rootkits

Hypervisor Level Rootkit

Acts as a hypervisor and modifies the boot sequence of the computer system to load the host operating system as a **virtual machine**

Boot Loader Level Rootkit

Replaces the original **boot loader** with one controlled by a remote attacker

Hardware/Firmware Rootkit

Hides in hardware devices or platform firmware which is not inspected for **code integrity**

Application Level Rootkit

Replaces regular **application binaries** with fake Trojan or modifies the behavior of existing applications by injecting malicious code

Kernel Level Rootkit

Adds malicious code or replaces original **OS kernel** and **device driver codes**

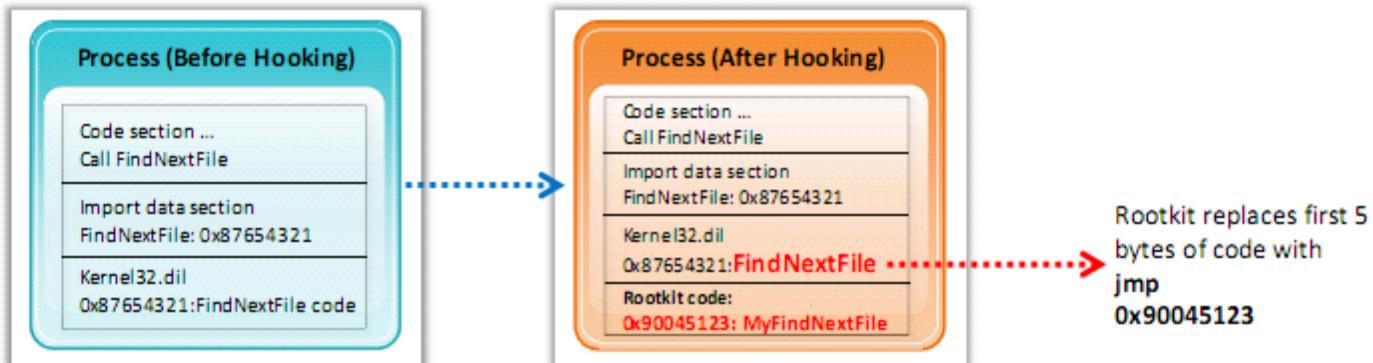

Library Level Rootkits

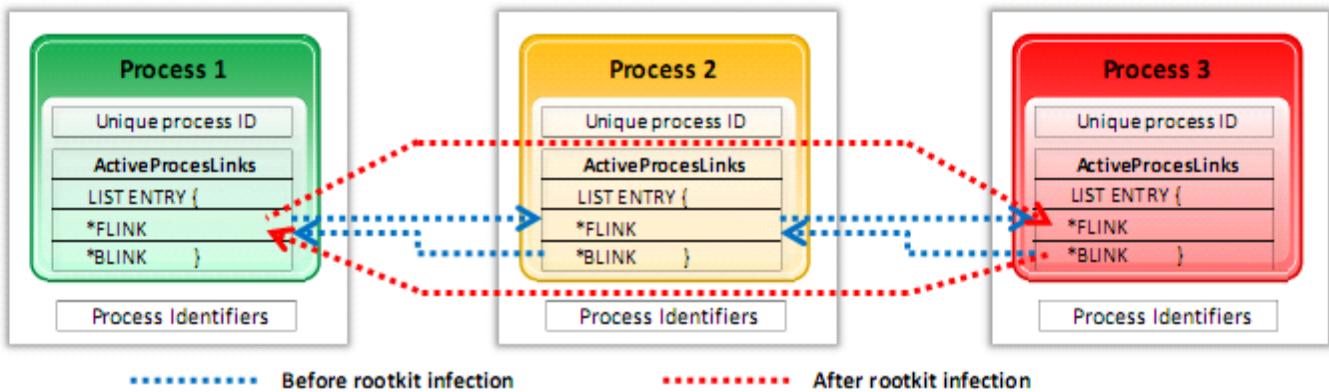

Replaces original system calls with fake ones to **hide information** about the attacker

How Rootkit Works

Hooks

Direct Kernel Object Manipulation (DKOM)

DKOM rootkits hide a process by unlinking it from the process list

Rootkits: Horse Pill and GrayFish

Horse Pill

- Horse Pill is Linux kernel rootkit that resides inside the “`initrd`” using which it infects the system and deceives the system owner with the use of **container primitives**
 - It has three important parts; `klibc-horsepill.patch`, `horsepill_setopt`, and `horsepill_infect`

```
root@gtfo:~# ls -l /proc/1/ns
total 0
lrwxrwxrwx 1 root root 0 Jul  8 16:47 ipc -> ipc:[4026531839]
lrwxrwxrwx 1 root root 0 Jul  8 16:47 mnt -> mnt:[4026531840]
lrwxrwxrwx 1 root root 0 Jul  8 16:47 net -> net:[4026531969]
lrwxrwxrwx 1 root root 0 Jul  8 16:47 pid -> pid:[4026531836]
lrwxrwxrwx 1 root root 0 Jul  8 16:47 user -> user:[4026531837]
lrwxrwxrwx 1 root root 0 Jul  8 16:47 uts -> uts:[4026531838]

root@gtfo:/usr/src/linux# cat -n include/linux/proc_ns.h | grep -A2 -B8
PROC_PID_INIT_INO
 31  /*
 32   * We always define these enumerators
 33   */
 34 enum {
 35     PROC_ROOT_INO      = 1,
 36     PROC_IPC_INIT_INO  = 0xFFFFFFFFFU,
 37     PROC_UTS_INIT_INO  = 0xFFFFFFFFEU,
 38     PROC_USER_INIT_INO = 0xFFFFFFFFDU,
 39     PROC_PID_INIT_INO  = 0xFFFFFFFFCU,
 40     PROC_CGROUP_INIT_INO= 0xFFFFFFFFBU,
 41   };

```

GrayFish

- GrayFish is a Windows kernel rootkit that runs inside the Windows operating system and provides an effective mechanism, **hidden storage**, and malicious command execution while remaining invisible
 - It injects its malicious code into the **boot record** which handles the launching of Windows at each step

Rootkits: Sirefef and Necurs

Sirefef

- Sirefef Rootkit or ZeroAccess **gives attackers full access to your system** while using stealth techniques in order to hide its presence from the affected device
- It hides itself by **altering the internal processes** of an operating system so that your antivirus and anti-spyware can't detect it

```

cmd.exe          2956 Console      0

Detecting Rootkits

Integrity-Based Detection

It compares a snapshot of the **file system**, **boot records**, or **memory** with a known trusted baseline

Signature-Based Detection

This technique compares characteristics of all **system processes** and **executable files** with a database of known rootkit fingerprints

Heuristic/Behavior - Based Detection

Any **deviations in the system's normal activity** or behavior may indicate the presence of rootkit

Runtime Execution Path Profiling

This technique compares **runtime execution paths** of all system processes and executable files before and after the rootkit infection

Cross View-Based Detection

Enumerates key elements in the computer system such as **system files**, **processes**, and **registry keys** and compares them to an **algorithm** used to generate a similar data set that does not rely on the common APIs. Any discrepancies between these two data sets indicate the presence of rootkit

Steps for Detecting Rootkits

Run "`dir /s /b /ah`" and "`dir /s /b /a-h`" inside the potentially infected OS and save the results

Step 1

Boot into a clean CD, run "`dir /s /b /ah`" and "`dir /s /b /a-h`" on the same drive and save the results

Step 2

Run a clean version of WinDiff on the two sets of results to detect file-hiding ghostware (i.e., invisible inside, but visible from outside)

Step 3

Note: There will be some false positives. Also, this does not detect stealth software that hides in BIOS, video card, EEPROM, bad disk sectors, Alternate Data Streams, etc.

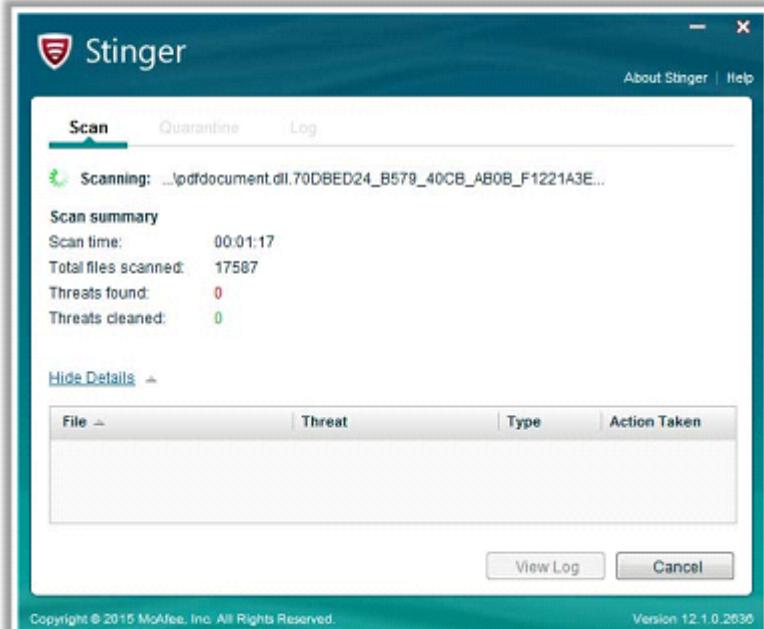

How to Defend against Rootkits

- 1 Reinstall OS/applications from a trusted source after backing up the critical data
- 2 Well-documented automated installation procedures need to be kept
- 3 Perform kernel memory dump analysis to determine the presence of rootkits
- 4 Harden the workstation or server against the attack
- 5 Educate staff not to download any files/programs from untrusted sources
- 6 Install network and host-based firewalls
- 7 Ensure the availability of trusted restoration media
- 8 Update and patch operating systems and applications
- 9 Verify the integrity of system files regularly using cryptographically strong digital fingerprint technologies
- 10 Update antivirus and anti-spyware software regularly
- 11 Avoid logging in an account with administrative privileges
- 12 Adhere to the least privilege principle
- 13 Ensure the chosen antivirus software posses rootkit protection
- 14 Do not install unnecessary applications and also disable the features and services not in use

Anti-Rootkits

Stinger

- Stinger scans rootkits, running processes, loaded modules, registry, and directory locations known to be used by **malware** on the machine

Avast Free Antivirus

<https://www.avast.com>

TDSSKiller

<https://usa.kaspersky.com>

Malwarebytes Anti-Rootkit

<https://www.malwarebytes.com>

Rootkit Buster

<http://www.trendmicro.co.in>

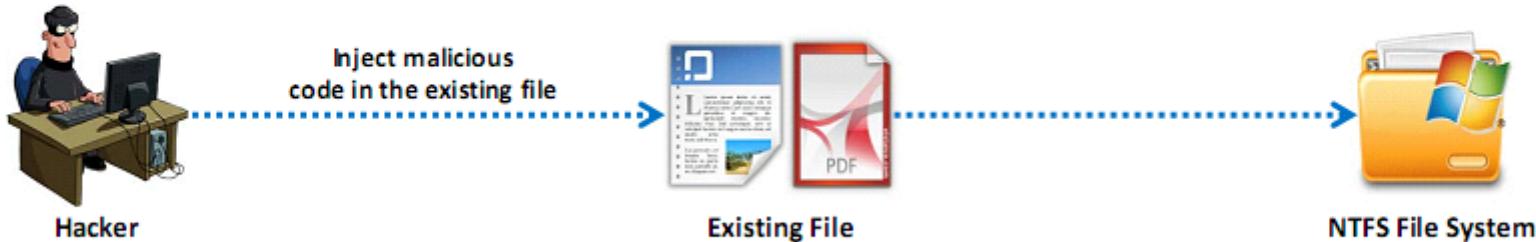

UnHackMe

<http://www.greatis.com>

NTFS Data Stream

NTFS Alternate Data Stream (ADS) is a **Windows hidden stream** which contains metadata for the file such as attributes, word count, author name and access, and modification time of the files.

ADS is the ability to **fork data into existing files** without changing or altering their functionality, size, or display to file browsing utilities.

ADS allows an attacker to **inject malicious code** in files on an accessible system and execute them without being detected by the user.

How to Create NTFS Streams

Notepad is stream compliant application

Step 1

- Launch `c:\>notepad myfile.txt:lion.txt`
- Click 'Yes' to create the new file, enter some data and **Save** the file

Step 2

- Launch `c:\>notepad myfile.txt:tiger.txt`
- Click 'Yes' to create the new file, enter some data and **Save** the file

Step 3

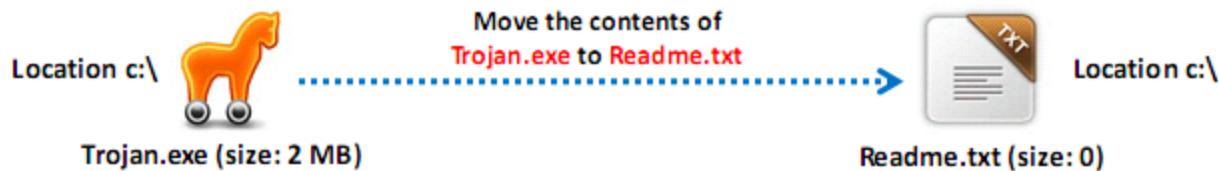

- View the file size of `myfile.txt` (It should be zero)

Step 4

- To view or modify the stream data hidden in step 1 and 2, use the following commands respectively:
`notepad myfile.txt:lion.txt`
`notepad myfile.txt:tiger.txt`

NTFS Stream Manipulation

01

To move the contents of Trojan.exe to Readme.txt (stream):

```
C:\>type c:\Trojan.exe > c:\Readme.txt:Trojan.exe
```

02

To create a link to the Trojan.exe stream inside the Readme.txt file:

```
C:\>mklink backdoor.exe Readme.txt:Trojan.exe
```

03

To execute the Trojan.exe inside the Readme.txt (stream), type:

```
C:\>backdoor
```

How to Defend against NTFS Streams

- To delete NTFS streams, move the **suspected files** to FAT partition 
- Use third-party **file integrity checker** such as Tripwire File Integrity Monitoring to maintain integrity of an NTFS partition files 
- Use programs such as **Stream Detector**, **LADS**, **ADS Detector**, etc. to detect streams 
- Enable **real-time antivirus scanning** to protect against execution of malicious streams in your system 
- Use **up-to-date antivirus software** on your system 

NTFS Stream Detectors

Stream Armor

- Stream Armor **discovers hidden Alternate Data Streams (ADS)** and cleans them completely from the system

The screenshot shows the Stream Armor software interface. At the top, it says "Scan & Clean Malicious 'Alternate Data Streams'". Below that is a status bar indicating "Now scanning: C:\Windows\WinSxS\amd64_amd64.inf.resources_31bf3856ad364e35_10.0.30586.0_en-u", "Scanned: 3637 folders, 7182 files", and "Elapsed time: 00 hrs 01 min 08 sec". The main window displays a table of files with columns: Stream Name, Size, Stream Content Type, Threat Analysis Information, Base Type, File Date, and Full Stream File Path. The "Threat Analysis Information" column uses color coding: green for "Safe", yellow for "Suspicious", and red for "Dangerous". A progress bar at the bottom indicates the scan is 24% complete.

What is Steganography?

01

Steganography is a technique of **hiding a secret message** within an ordinary message and **extracting it at the destination** to maintain confidentiality of data

02

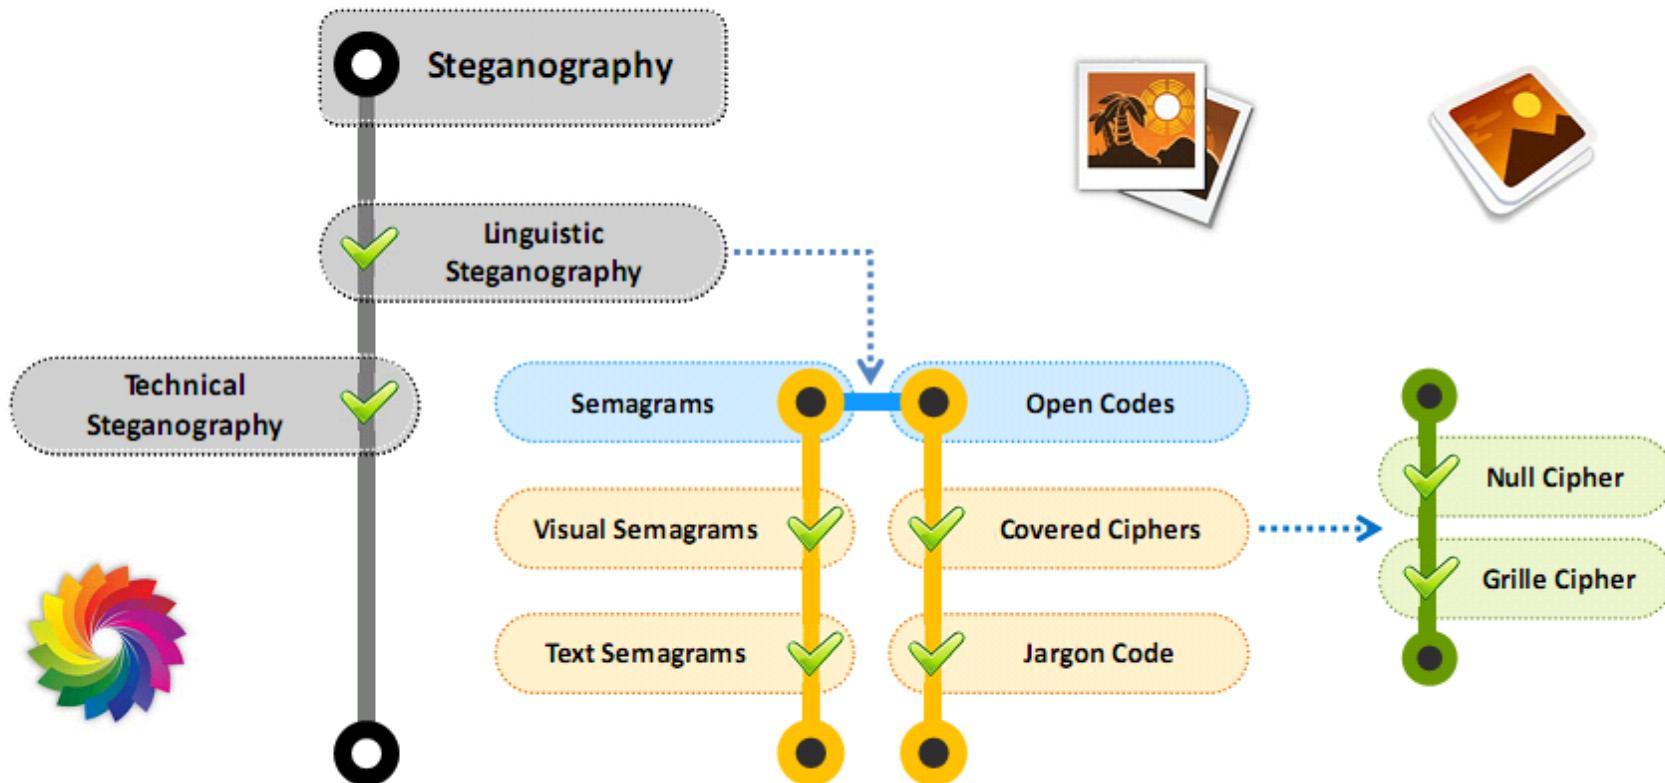

Utilizing a graphic image as a **cover** is the most popular method to conceal the data in files

03

Attacker can use steganography to hide messages such as **list of the compromised servers**, source code for the hacking tool, plans for future attacks, etc.

Classification of Steganography

Types of Steganography based on Cover Medium

01

Image Steganography

07

Web Steganography

02

Document Steganography

08

Spam/Email Steganography

03

Folder Steganography

09

DVD-ROM Steganography

04

Video Steganography

10

Natural Text Steganography

05

Audio Steganography

11

Hidden OS Steganography

06

White Space Steganography

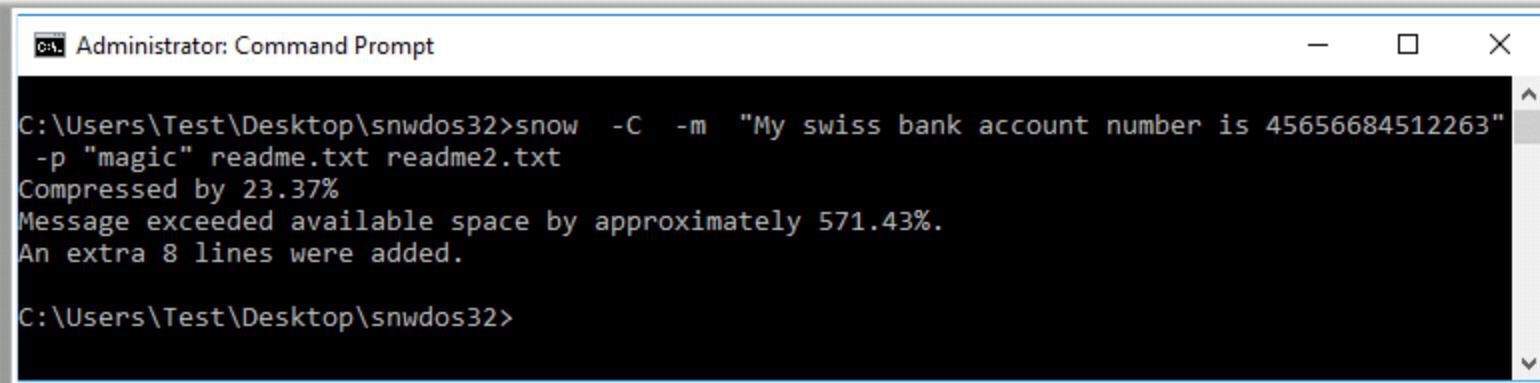

12

Source Code Steganography

Whitespace Steganography

- In white space steganography, user **hides the messages in ASCII text** by adding white spaces to the end of the lines
- Because spaces and tabs are generally not visible in **text viewers**, therefore the message is effectively hidden from casual observers
- Use of **built-in encryption** makes the message unreadable even if it is detected
- Use **SNOW** tool to hide the message

```
Administrator: Command Prompt
C:\Users\Test\Desktop\snwdos32>snow -C -m "My swiss bank account number is 45656684512263"
-p "magic" readme.txt readme2.txt
Compressed by 23.37%
Message exceeded available space by approximately 571.43%.
An extra 8 lines were added.

C:\Users\Test\Desktop\snwdos32>
```

<http://www.darkside.com.au>

Image Steganography

- In image steganography, the **information is hidden in image** files of different formats such as .PNG, .JPG, .BMP, etc.
- Image steganography tools **replace redundant bits of image** data with the message in such a way that the effect cannot be detected by human eyes

Image File Steganography Techniques

Least Significant Bit Insertion

- The binary data of the message is broken and inserted into the **LSB of each pixel** in the image file in a deterministic sequence

Masking and Filtering

- Masking and filtering techniques **hide data using a method similar to watermarks on actual paper** and it can be done by modifying the luminance of parts of the image

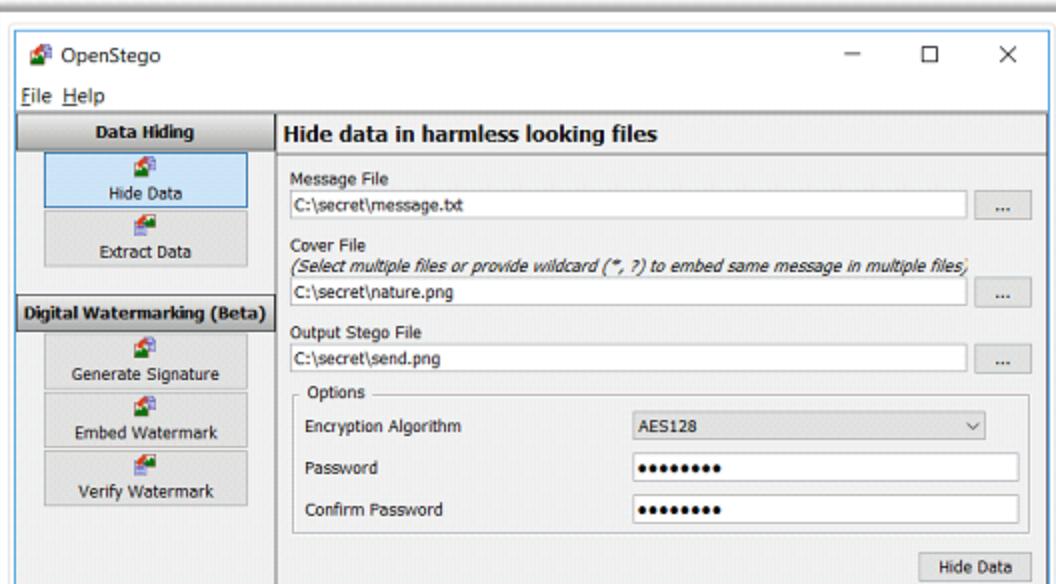

Algorithms and Transformation

- Hide data in **mathematical functions** used in compression algorithms
- The data is embedded in the cover image by **changing the coefficients of a transform of an image**

Image Steganography Tools

OpenStego

- **Data Hiding:** It can hide any data within a cover file (e.g. images)
- **Watermarking:** Watermarking files (e.g. images) with an invisible signature.
It can be used to detect unauthorized file copying

QuickStego

<http://quickcrypto.com>

Cryptapix

<https://www.briggsoft.com>

Hide In Picture

<https://sourceforge.net>

gifshuffle

<http://www.darkslide.com.au>

PHP-Class Stream Steganography

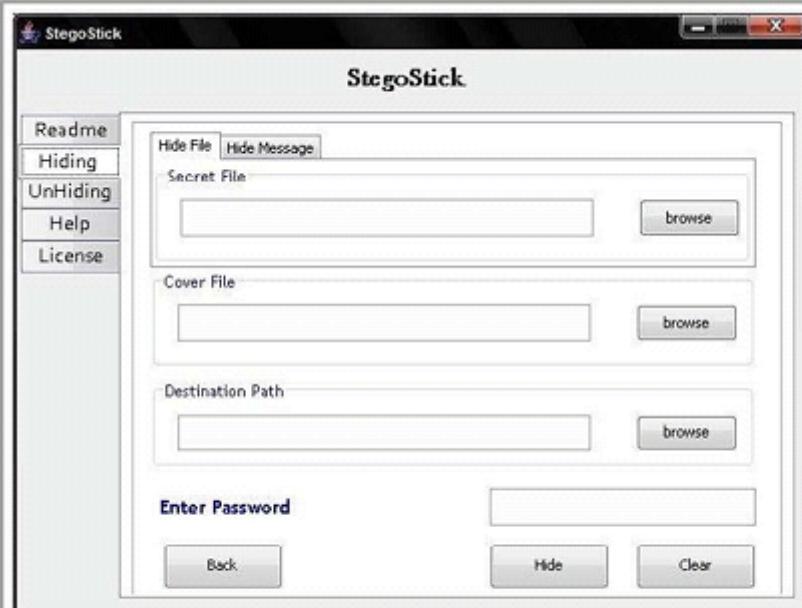

<https://www.phpclasses.org>

Document Steganography

- Document steganography is the technique of **hiding secret messages** transferred in the **form of documents**
- It includes **addition of white spaces and tabs** at the end of the lines

StegoStick

It hides any file or message into an image (BMP,JPG,GIF), Audio/Video (MPG, WAV, etc.) or any other file format (PDF,EXE,CHM, etc.)

Document Steganography Tools

- StegJ (<http://stegj.sourceforge.net>)
- Office XML (<https://www.irongeek.com>)
- SNOW (<http://www.darkside.com.au>)
- Data Stash (<http://www.skyjuicesoftware.com>)
- Hydan (<http://www.crazyboy.com>)

Video Steganography

- Video steganography refers to **hiding secret information** into a carrier video file
- In video steganography, the information is hidden in **video files** of different formats such as .AVI, .MPG4, .WMV, etc.
- **Discrete Cosine Transform (DCT)** manipulation is used to add secret data at the time of the transformation process of video

Video Steganography Tools

- RT Steganography (<https://rtstegvideo.sourceforge.net>)
- StegoStick (<https://sourceforge.net>)
- OpenPuff (<http://embeddedsw.net>)
- MSU StegoVideo (<http://www.compression.ru>)

OmniHide Pro

OmniHide Pro **hides a file within another file**. Any file can be hidden within common image/music/ video/document formats. The output file would work just as the original source file

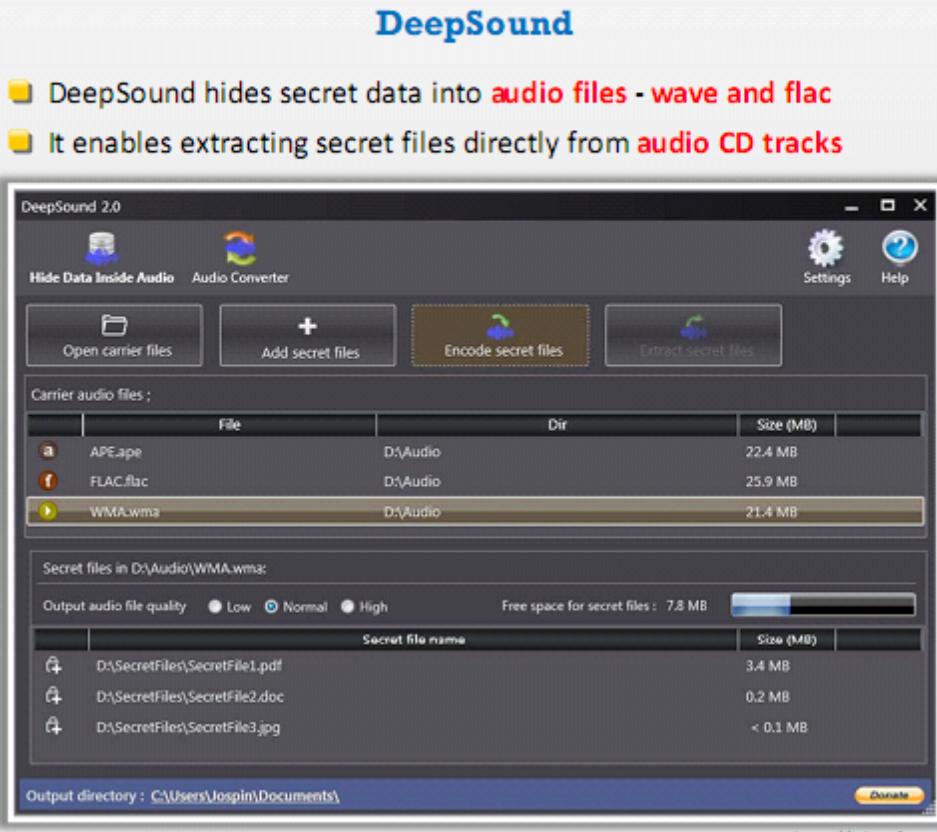

<http://omnihide.com>

Audio Steganography

- Audio steganography refers to **hiding secret information in audio files** such as .MP3, .RM, .WAV, etc.
- Information can be hidden in an audio file by using **LSB** or by using **frequencies** that are inaudible to the human ear (>20,000 Hz)
- Some of the audio steganography methods are **echo data hiding, spread spectrum method, LSB coding, tone insertion, phase encoding**, etc.

Audio Steganography Tools

- BitCrypt (<http://bitcrypt.moshe-szweizer.com>)
- SilentEye (<http://silenteye.v1kings.io>)
- CHAOS Universal (<http://safechaos.com>)
- StegoStick (<https://sourceforge.net>)
- MP3Stego (<http://www.petitcolas.net>)

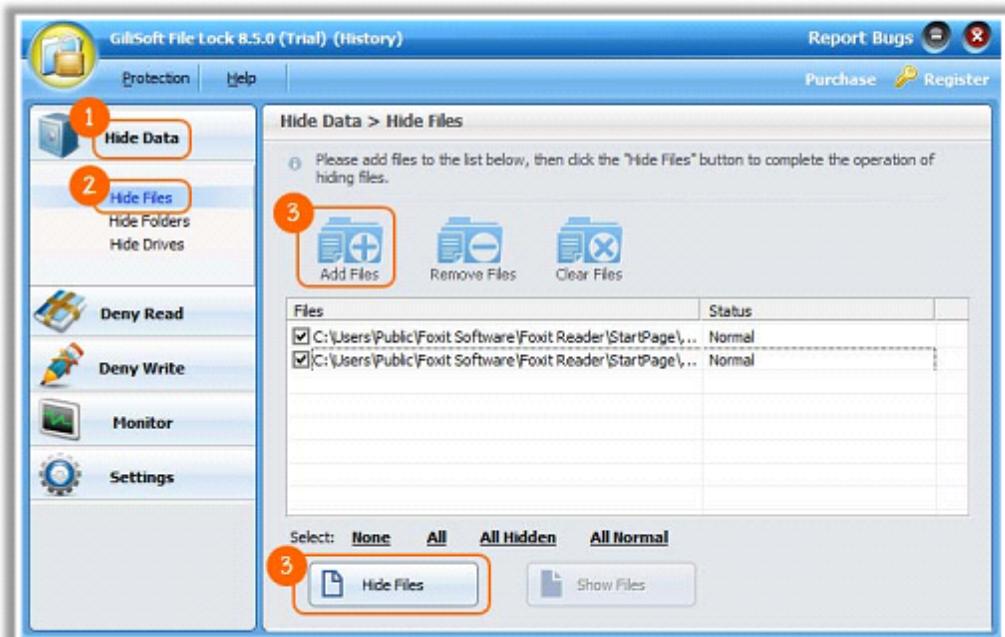

Folder Steganography

- In Folder steganography, **Files are hidden and encrypted** within a folder and do not appear to normal Windows applications, including Windows Explorer

Folder Steganography Tools

- [Folder Lock](http://www.newsoftwares.net) (<http://www.newsoftwares.net>)
- [Hide Folders 5](https://fspro.net) (<https://fspro.net>)
- [WinMend Folder Hidden](http://www.winmend.com) (<http://www.winmend.com>)
- [Invisible Secrets 4](http://www.invisiblesecrets.com) (<http://www.invisiblesecrets.com>)
- [Max Folder Secure](http://maxpcsecure.com) (<http://maxpcsecure.com>)

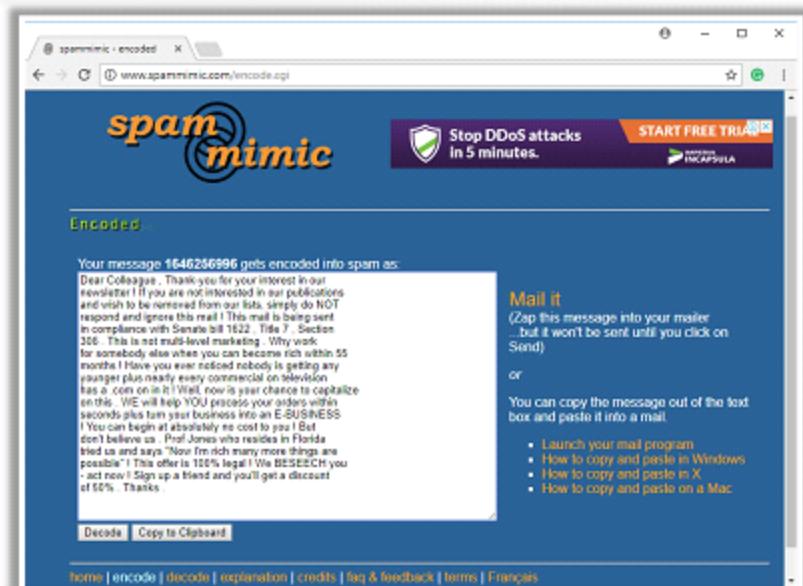

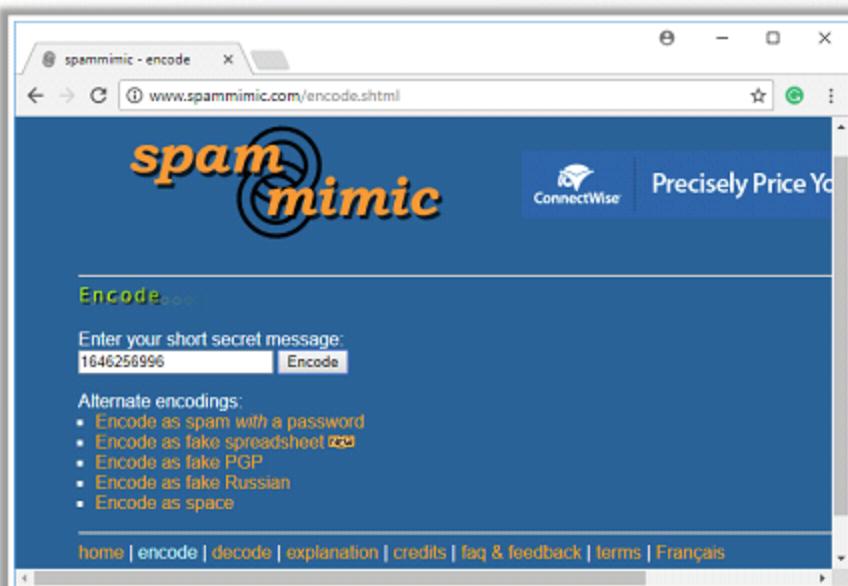

GiliSoft File Lock Pro
It lock files, folders, and drives; hide files, folders, and drives to make them invisible; or password protects files folders, and drives

<http://www.gillsoft.com>

Spam/Email Steganography

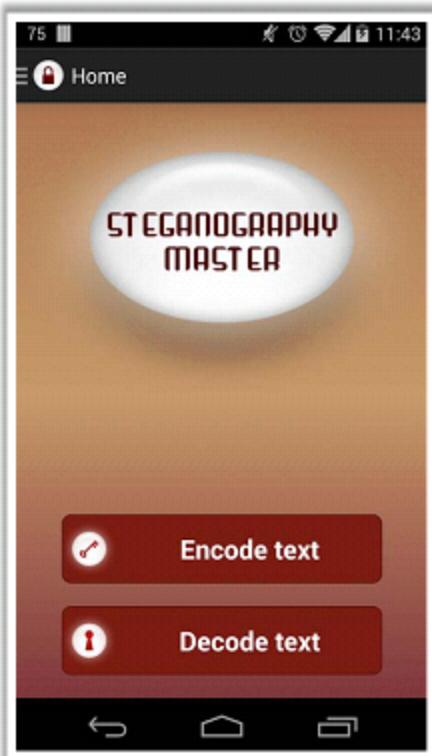

- Spam/email steganography refers to the technique of **sending secret messages by hiding them in spam/email messages**
- Spam emails help to **communicate secretly** by embedding the secret messages in some way and **hiding the embedded data in the spam emails**
- **Spam Mimic** is a spam/email steganography tool that encodes the secret message into an innocent looking spam emails

Steganalysis

Reverse Process of Steganography

- Steganalysis is the art of **discovering** and **rendering covert messages** using steganography
- It **detects the hidden messages** embedded in images, text, audio, and video carrier mediums using steganography

Challenge of Steganalysis

Suspect information stream may or may not have encoded hidden data

Efficient and accurate detection of hidden content within digital images is difficult

The message might have been encrypted before inserting into a file or signal

Some of the suspect signals or files may have irrelevant data or noise encoded into them

Steganalysis Methods/Attacks on Steganography

Stego-only

Only the stego object is available for analysis

Known-stego

Attacker has access to the stego algorithm and both the cover medium and the stego-object

Known-message

Attacker has access to the hidden message and the stego object

Known-cover

Attacker compares the stego-object and the cover medium to identify the hidden message

Chosen-message

This attack generates stego objects from a known message using specific steganography tools in order to identify the steganography algorithms

Chosen-stego

Attacker has access to the stego-object and stego algorithm

Detecting Steganography

(Text, Image, Audio, and Video Files)

Text File

- For the text files, the alterations are made to the **character positions** for hiding the data
- The alterations are detected by looking for **text patterns** or disturbances, language used, and an unusual amount of blank spaces

Image File

- The hidden data in an image can be detected by **determining changes** in size, file format, the last modified timestamp, and the color palette pointing to the existence of the hidden data
- Statistical analysis** method is used for image scanning

Audio File

- Statistical analysis method can be used for detecting audio steganography as it involves **LSB modifications**
- The **inaudible frequencies** can be scanned for hidden information
- The **odd distortions and patterns** show the existence of the secret data

Video File

- Detection of the secret data in video files includes a **combination of methods** used in image and audio files

Steganography Detection Tools

Gargoyle Investigator™ Forensic Pro

- Gargoyle Investigator™ Forensic Pro provides inspectors with the ability to conduct a quick search on a given computer or machine for known contraband and hostile programs

The screenshot shows the Gargoyle Investigator Forensic Pro interface. At the top, there are two date selection boxes: 'Analysis Start Date' (set to March 1994) and 'Analysis End Date' (set to March 2012). Below these are buttons for 'Display Dates' (Modified, Accessed, Created), 'Available Timeline Ranges' (Timeline: 3/6/1994 to 3/2/2012; Modified: 3/6/1994 to 8/22/2004; Accessed: 3/2/2012 to 3/2/2012; Created: 6/13/2006 to 6/13/2006), and buttons for 'Plot Timeline' and 'Clear Timeline'. The main area features a timeline from April 2000 to March 2001 with several orange markers indicating specific events. A detailed log table at the bottom lists various steganography-related files and their metadata.

Category	Program	File Name	Modified Time	Access Time	Create
Steganography	BindSide	BindSide.exe	4/29/2000 11:04:18 AM	3/2/2012	6/13/2006 3:59:52 PM
Steganography	BindSide	Copy (2) of BSIDE.EXE	4/29/2000 11:04:18 AM	3/2/2012	6/13/2006 3:59:53 PM
Steganography	BindSide	Copy of BSIDE.EXE	4/29/2000 11:04:18 AM	3/2/2012	6/13/2006 3:50:53 PM
Steganography	Wav2Wav	GUITARWAV2.EXE	1/26/2002 9:15:16 AM	3/2/2012	6/13/2006 3:55:15 PM
Steganography	S-Tools	S-Tools.exe	5/7/1998 8:25:56 AM	3/2/2012	6/13/2006 3:55:38 PM
Steganography	S-Tools	ST-WAV.EXE	4/15/1995 9:30:24 PM	3/2/2012	6/13/2006 3:55:41 PM

2 Cracking Passwords

3 Escalating Privileges

4 Executing Applications

5 Hiding Files

6 Covering Tracks

7 Penetration Testing

Covering Tracks

- Once intruders have successfully gained administrator access on a system, they will try to **cover the tracks to avoid their detection**

Attacker uses the following techniques to cover tracks on the target system

1 Disable Auditing: Disables auditing features of the target system

2 Clearing Logs: Clear/delete the system log entries corresponding to his/her activities

3 Manipulating Logs: Manipulates logs in such a way that he/she will not be caught in legal actions

Disabling Auditing: Auditpol

- Intruders will **disable auditing** immediately after gaining administrator privileges
- At the end of their stay, the intruders will just turn on auditing again using **auditpol.exe**

```
Administrator: Command Prompt

C:\Users\Administrator>auditpol /set /category:"system","account logon" /success:enable /failure:disable
The command was successfully executed.

C:\Users\Administrator>auditpol /get /category:*
System audit policy
Category/Subcategory          Setting
System
  Security System Extension    Success and Failure
  System Integrity             Success and Failure
  IPsec Driver                 Success and Failure
  Other System Events          Success and Failure
  Security State Change        Success and Failure
Logon/Logoff
  Logon                        Success and Failure
  Logoff                       Success
  Account Lockout              Success
  IPsec Main Mode              No Auditing
  IPsec Quick Mode             No Auditing
  IPsec Extended Mode          No Auditing
  Special Logon                Success
  Other Logon/Logoff Events    No Auditing
  Network Policy Server         Success and Failure
  User / Device Claims          No Auditing
  Group Membership              No Auditing
Object Access
  File System                  No Auditing
  Registry                      No Auditing
  Kernel Object                 No Auditing
  SAM                           No Auditing
  Certification Services        No Auditing
  Application Generated        No Auditing
  Handle Manipulation           No Auditing
```

<https://technet.microsoft.com>

Clearing Logs

Attacker uses **Clear_Event_Viewer_Logs.bat** or **clearlogs.exe** utility to clear the security, system, and application logs

```
C:\WINDOWS\System32\cmd.exe
clearing "Microsoft-Windows-AppModel-Runtime/Debug"
clearing "Microsoft-Windows-AppModel-Runtime/Diagnostics"
clearing "Microsoft-Windows-AppModel-State/Debug"
clearing "Microsoft-Windows-AppModel-State/Diagnostic"

Manually Clearing Event Logs

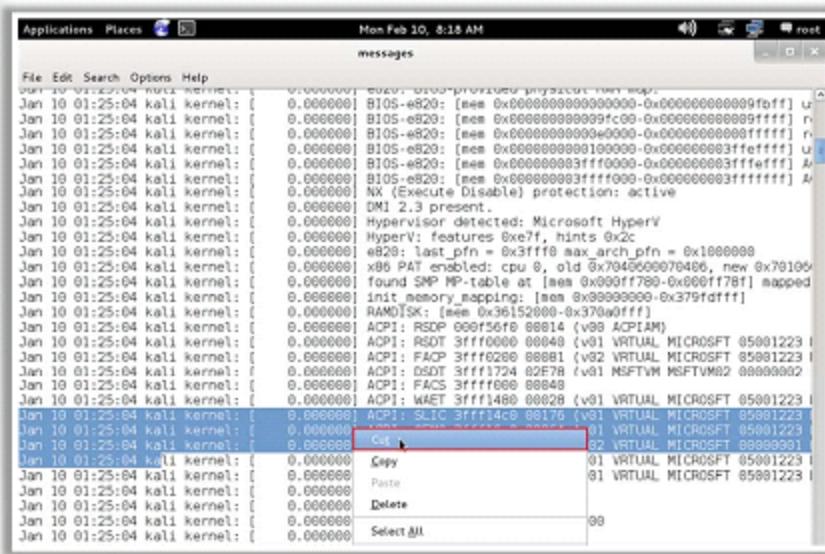

Windows

- Navigate to Start → Control Panel → System and Security → Administrative Tools → double click Event Viewer
- Delete the all the log entries logged while compromising of the system

Linux

- Navigates to /var/log directory on the Linux system
- Open plain text file containing log messages with text editor /var/log/messages
- Delete all the log entries logged while compromising of the system

Ways to Clear Online Tracks

- Remove **Most Recently Used (MRU)**, delete cookies, clear cache, turn off AutoComplete, and clear Toolbar data from the browsers

From the Privacy Settings in Windows 10

- Right-click on the **Start** button, choose **Settings**, and click on "**Personalization**"
- In Personalization, click **Start** from the left pane and Turn Off both "**Show most used apps**" and "**Show recently opened items in Jump Lists on Start or the taskbar**"

From the Registry in Windows 10

- Open the **Registry Editor** and navigate to **HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Explorer** and then remove the key for "Recent Docs"
- Delete all the values except "**(Default)**"

- The BASH is an **sh-compatible shell** which stores command history in a file called **bash_history**
 - You can view the saved command history using **more ~/.bash_history** command

Attackers use following commands to clear the saved command history tracks:

Disabling history

- ```
• export HISTSIZE=0
```

## Clearing the history

- `history -c` (Clears the stored history)

- `history -w` (Clears history of current shell)

#### ■ Clearing the user's complete history

- ```
• cat /dev/null > ~.bash_history && history -c && exit
```

■ Shredding the history

- `shred ~/.bash_history` (Shreds the history file, making its content unreadable)

- ```
• shred ~/.bash_history && cat /dev/null > .bash_history && history -c && exit (Shreds the history file and clear the evidence of the command)
```

```
root@kali:~# more ~/.bash_history
hping3 -A 192.168.0.1 -p 80
more ~/.bash_history
cd Desktop
cd Desktop/
ls
cd TEST/
ls
python spraywmi.py
python TEST.py
clear
more ~/.bash_history
root@kali:~# export HISTSIZE=0
root@kali:~# history -c
root@kali:~# history -w
root@kali:~# cat /dev/null > ~/.bash_history && history -c && exit
root@kali:~# shred ~/.bash_history
root@kali:~# more ~/.bash_history

root@kali:~# shred ~/.bash_history && cat /dev/null > .bash_history && history -c && exit
```

# Covering Tracks on Network

## Using Reverse HTTP Shells

- Attacker installs reverse HTTP shell on victim's machine, which is programmed in such a way that it would ask for commands to an external master who controls the reverse HTTP shell
- Victim here will act as a web client who is executing HTTP GET commands whereas the attacker behaves like a web server and responds to the requests
- This type of traffic is considered as a normal traffic by an organization's network perimeter security like DMZ, firewall, etc.

## Using Reverse ICMP Tunnels

- Attacker uses ICMP tunneling technique to use ICMP echo and ICMP reply packets as a carrier of TCP payload, to access or control a system stealthily
- Victim's system is triggered to encapsulate TCP payload in an ICMP echo packet which is forwarded to the proxy server
- Organizations have security mechanisms that only check incoming ICMP packets but not outgoing ICMP packets, therefore attackers can easily bypass firewall

# Covering Tracks on Network (Cont'd)

## Using DNS Tunneling

- Attackers can use DNS tunneling to **encode malicious content** or data of other programs within DNS queries and replies
- DNS tunneling **creates a back channel** to access a remote server and applications
- Attackers can make use of this back channel to **exfiltrate stolen confidential** or sensitive information from the server

## Using TCP Parameters

- TCP parameters can be used by the attacker to **distribute the payload** and to create **covert channels**
- TCP fields where data can be hidden are as follow:
  - IP Identification field
  - TCP acknowledgement number
  - TCP initial sequence number

# Covering Tracks on OS

## Windows

- NTFS has a feature called as **Alternate Data Streams** that allows attackers to hide a file behind other normal files
- Given below are some steps in order to hide file using NTFS:
  - Open the command prompt with an elevated privilege
  - Type the command “`type C:\SecretFile.txt > C:\LegitFile.txt:SecretFile.txt`” (here, file is kept in C drive where SecretFile.txt file is hidden inside LegitFile.txt file)
  - To view the hidden file, type “`more < C:\SecretFile.txt`” (for this you need to know the hidden file name)

```
Administrator: Command Prompt
C:\>type C:\SecretFile.txt > C:\LegitFile.txt:SecretFile.txt
C:\>more < C:\SecretFile.txt
ahjdajdn
C:\>
```

A red box highlights the text "ahjdajdn" in the command output, with a callout bubble labeled "Hidden Content".

## UNIX

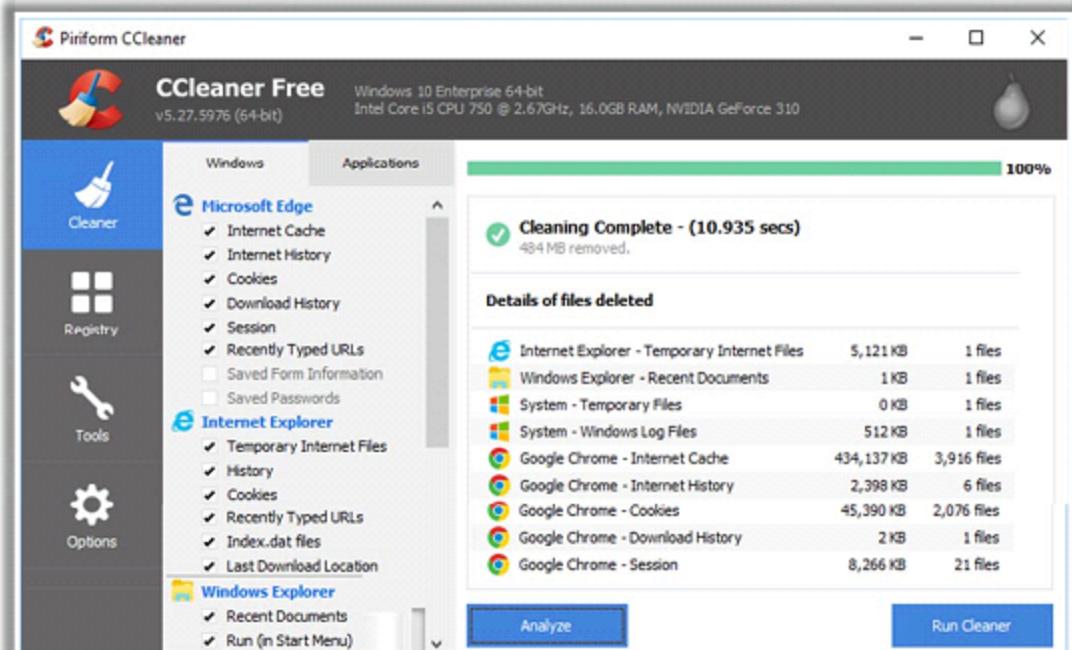

- Files in UNIX can be hidden just by **appending a dot (.)** in front of a file name
- Attackers can use this feature to edit the **log files** to cover their tracks
- Attackers can use “`export HISTSIZE=0`” command to delete the command history and the specific command they used to hide log files

```
root@kali:~/Desktop/TEST# ls
CHANGELOG dirtyc0w.c README.md spraywmi.py TEST.py Utilities
dirtyc0w hello_world.txt Responder-master test_1.txt unicorn wmis
root@kali:~/Desktop/TEST# mv test_1.txt .test_1.txt
root@kali:~/Desktop/TEST# ls
CHANGELOG dirtyc0w.c README.md spraywmi.py unicorn wmis
dirtyc0w hello_world.txt Responder-master TEST.py Utilities
root@kali:~/Desktop/TEST#
```

# Covering Tracks Tools

## CCleaner

- CCleaner cleans traces of temporary files, log files, registry files, memory dumps, and also your **online activities** such as your Internet history

<https://www.piriform.com>

## DBAN

<http://www.cybertransoft.com>

## Privacy Eraser

<http://www.cybertransoft.com>

## Wipe

<https://privacyroot.com>

## BleachBit

<https://www.bleachbit.org>

## ClearProg

<http://www.clearprog.de>

# Module Flow

**1** System Hacking Concepts

**2** Cracking Passwords

**3** Escalating Privileges

**4** Executing Applications

**5** Hiding Files

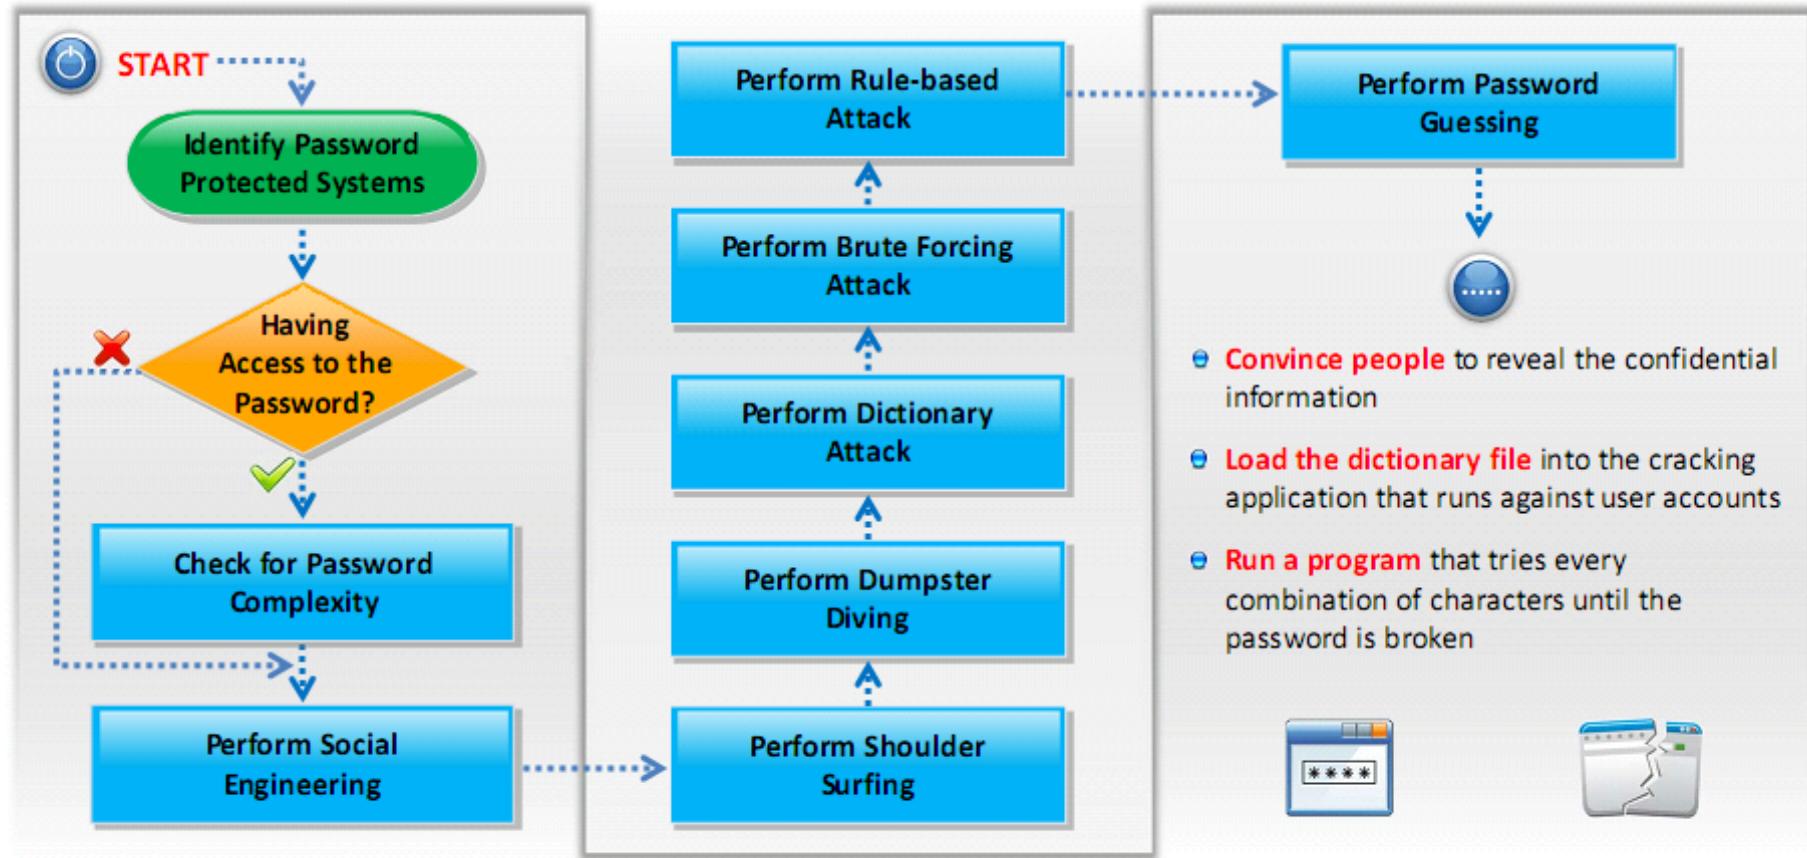

**6** Covering Tracks

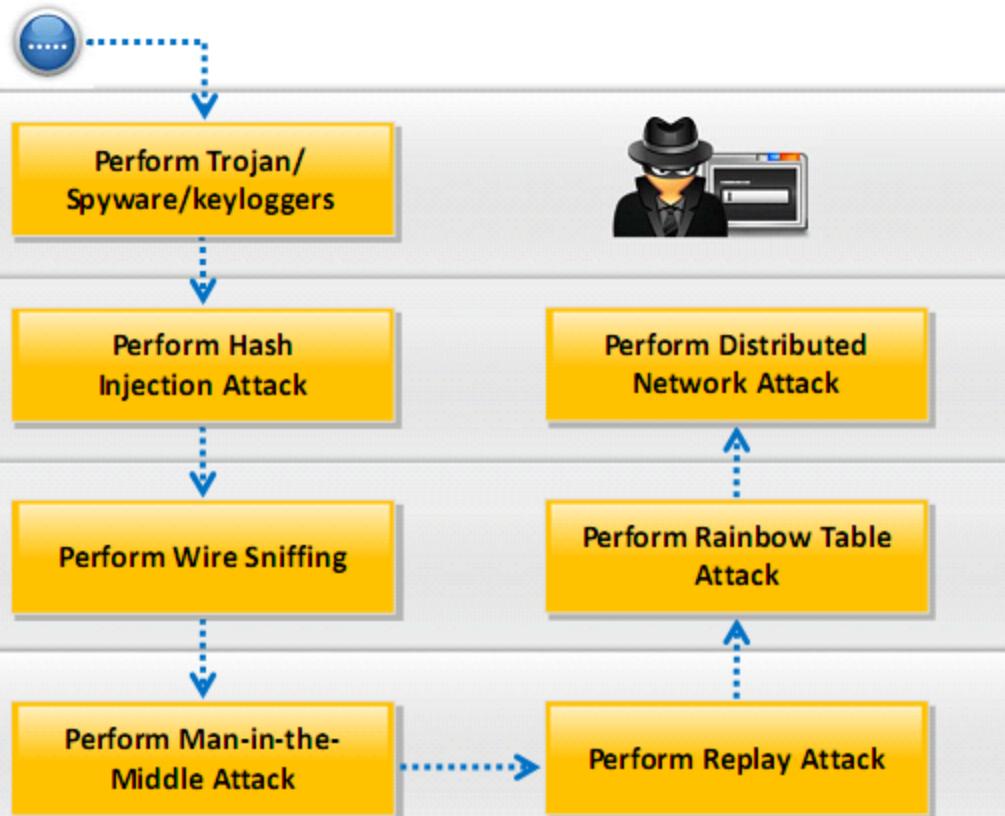

**7** Penetration Testing

# Password Cracking

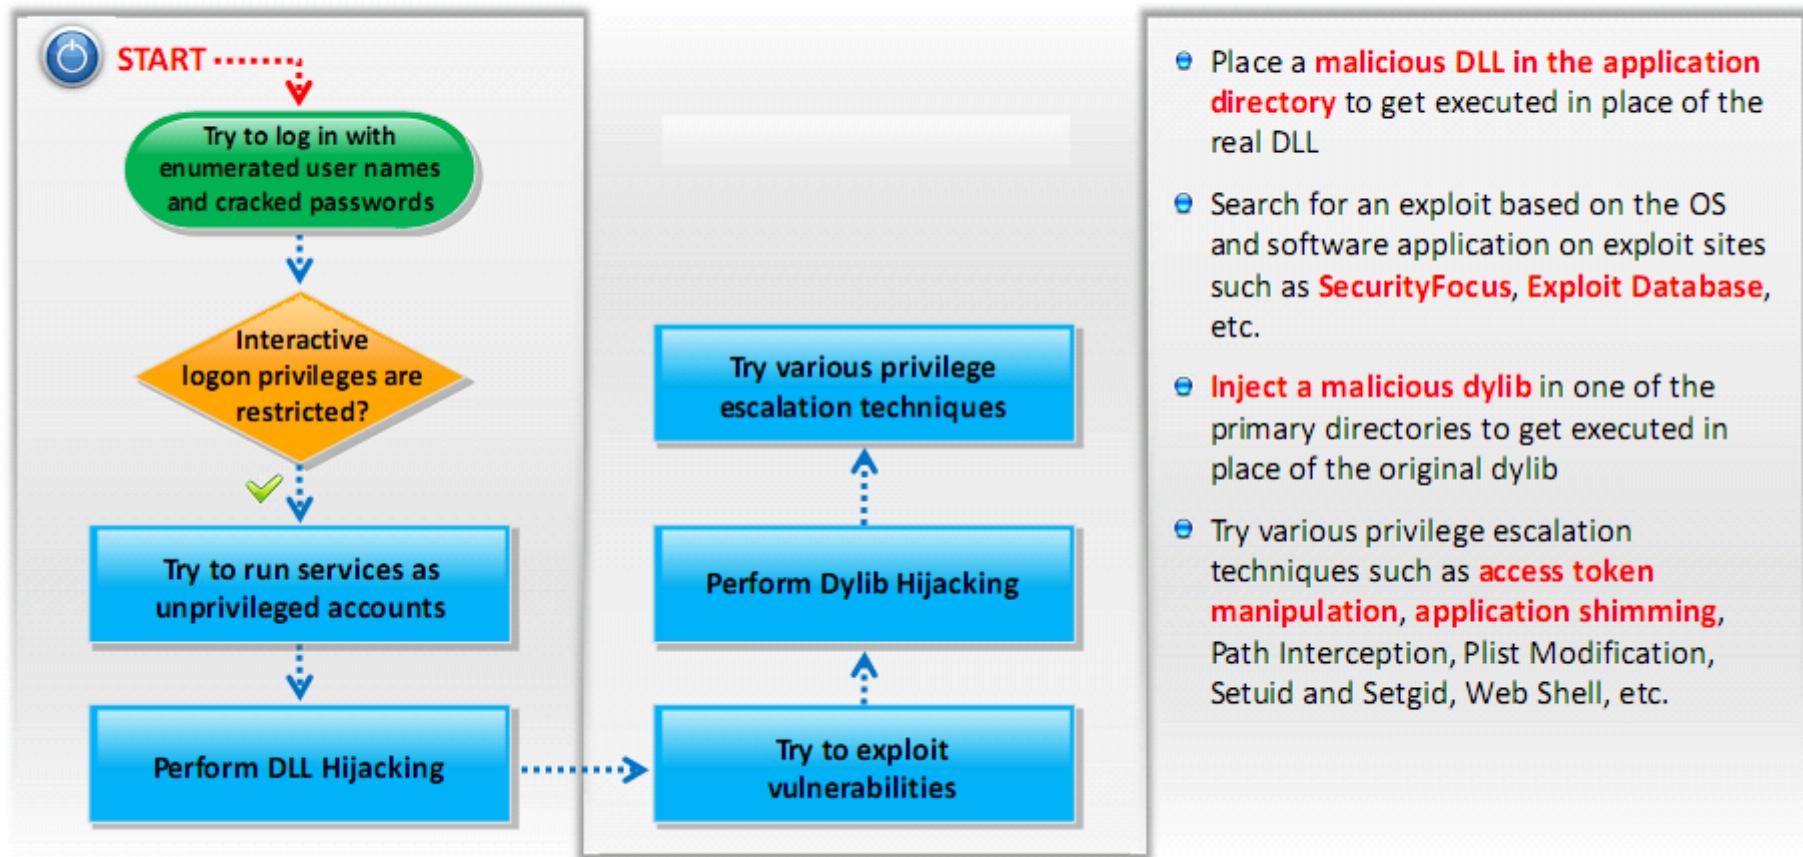

# Password Cracking (Cont'd)

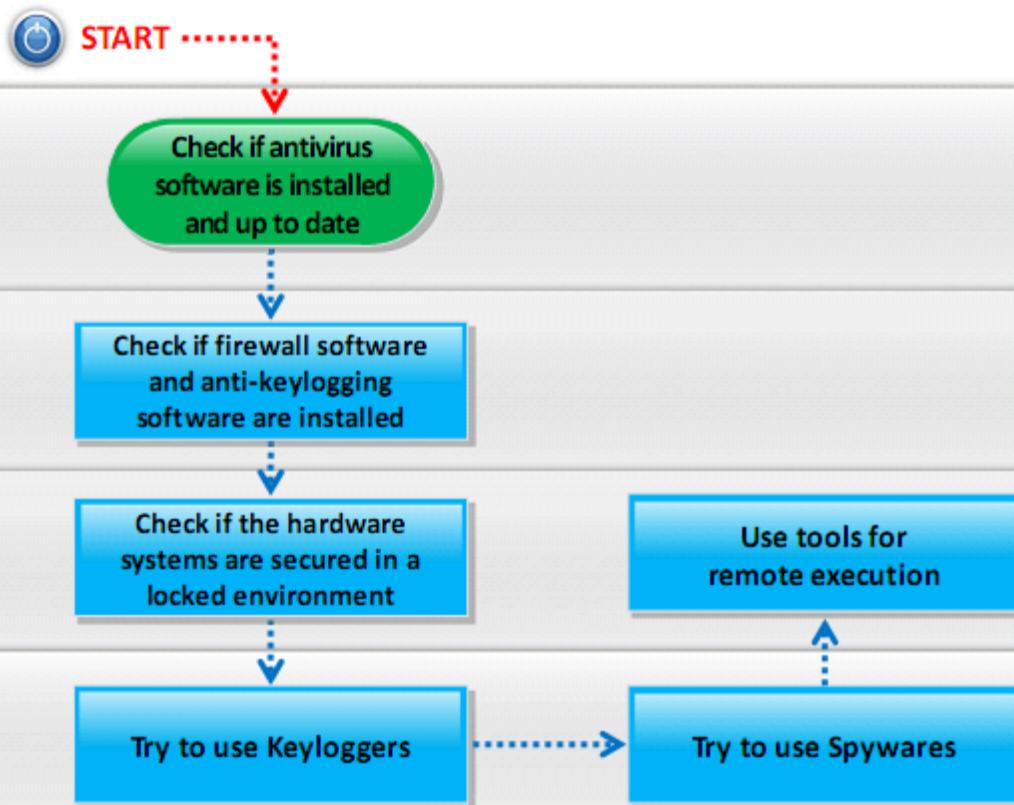

- ➊ Record every keystroke that an user types using keyloggers
- ➋ Secretly gather person or organization personal information using spyware
- ➌ With the help of a Trojan, get access to the stored passwords in the Trojaned computer
- ➍ Inject a compromised hash into a local session and use the hash to validate to network resources
- ➎ Run packet sniffer tools on the LAN to access and record the raw network traffic that may include passwords sent to remote systems
- ➏ Acquires access to the communication channels between victim and server to extract the information
- ➐ Use a Sniffer to capture packets and authentication tokens. After extracting relevant info, place back the tokens on the network to gain access
- ➑ Recover password-protected files using the unused processing power of machines across the network to decrypt password

# Privilege Escalation

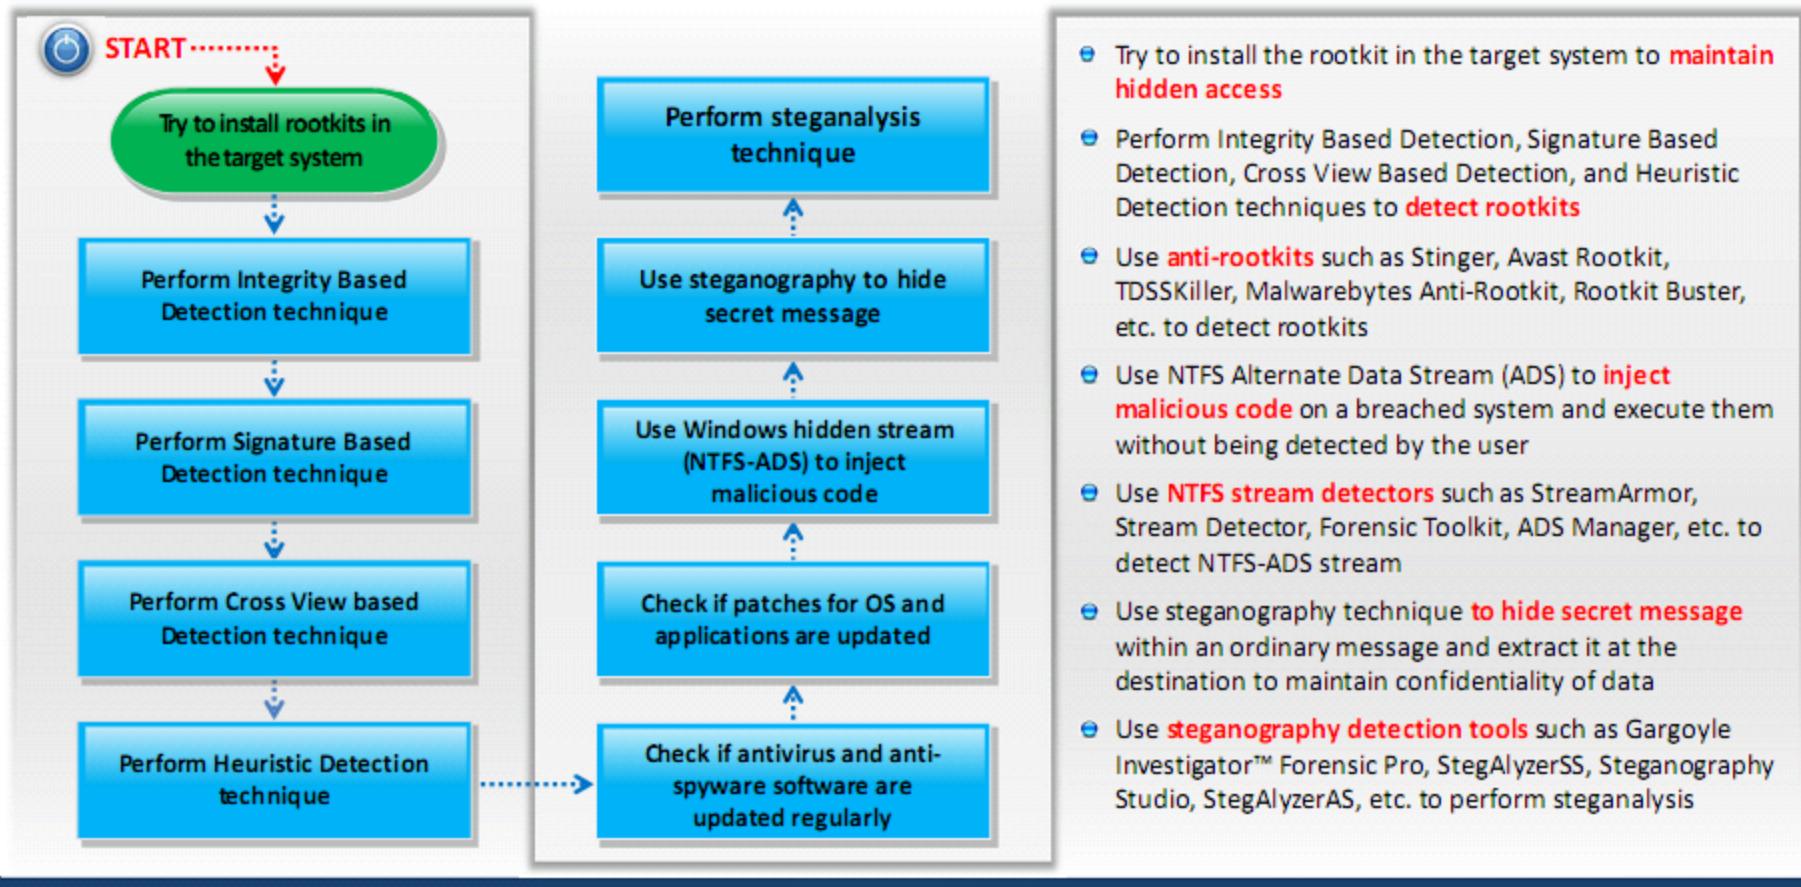

# Executing Applications

- Use **keyloggers** such as All In One Keylogger, Spyrix Personal Monitor, SoftActivity Activity Monitor, Elite Keylogger, etc.
- Use **spywares** such as Spytech SpyAgent, Power Spy, ACTIVTrak, Veriato 360, NetVizor, Activity Monitor, etc.
- Use remote execution tools such as RemoteExe, PDQ Deploy, Dameware Remote Support, etc. to **install application remotely**

# Hiding Files

# Covering Tracks

START

Remove web activity tracks

Disable auditing

Tamper log files

Clear BASH shell tracks

Close any opened port

Clear tracks on network

Close all remote connections to the victim machine

- Remove **web activity tracks** such as MRU, cookies, cache, temporary files and history using **Clear\_Event\_Viewer\_Logs.bat** utility and **meterpreter** shell
- Disable auditing using tool such as **Auditpol**
- Tamper log files such as event log files, server log files and proxy log files by **log poisoning** or **log flooding**
- Use command like **history -c, cat /dev/null > ~.bash\_history && history -c && exit**, etc. to clear BASH shell tracks
- Cover tracks on network using Reverse HTTP Shells, Reverse ICMP Tunnels, and TCP Parameters
- Use **track covering tools** such as CCleaner, AVG TuneUp, Privacy Eraser, Wipe, etc.

# Module Summary

- Attackers use a variety of means to penetrate systems, such as:
  - Uses password cracking techniques to gain unauthorized access to the vulnerable system
  - Creates a list (dictionary) of all possible passwords from the information collected through social engineering and perform dictionary, brute force, and rule-based attack on the victim's machine to crack the passwords
  - Performs privilege escalation attack which takes advantage of design flaws, programming errors, bugs, and configuration oversights in the OS and software application to gain administrative access to the network and its associated applications
  - Executes malicious programs remotely in the victim's machine to gather information
  - Uses keystroke loggers and spywares to gather confidential information about victim such as email ID, passwords, banking details, chat room activity, IRC, instant messages, etc.
  - Uses rootkits to hide their presence as well as malicious activities, which grant them full access to the server or host at that time and also in future
  - Uses steganography techniques to hide messages such as list of the compromised servers, source code for the hacking tool, communication and coordination channel, plans for future attacks, etc.
- Once intruders have successfully gained administrator access on a system, they will try to cover the tracks to avoid their detection
